Change log

Ver-sion	Date	Author	Status	Comments
1.0	18-12-2024	Cina Arjmand	Final	Original first version containing Release 6.1.5-RC11 de-scription.
1.1	29-01-2025	Uffe Bundesen	Final	Updated with notes from Release 6.1.5-final and 6.1.5-RC12.
1.2	06-03-2025	Johan Lövberg	Final	Updated with notes from release 6.1.5.1-RC2, 6.1.5.1-RC3,6.1.5.1-RC3.1, 6.1.5.1-RC3.2, 6.1.5.1-RC3.3 and 6.1.5.1-final.
1.3	10-04-2025	Johannes Bæk	Final	Updated notes from release 6.1.5.2-RC1, 6.1.5.2-RC1.1, 6.1.5.2-RC2, 6.1.5.2-RC3, 6.1.5.2-RC3.1, 6.1.5.2-RC4, and 6.1.5.2-RC5.
1.4	24-04-2025	Johannes Bæk	Final	Updated notes from release 6.1.5.2-RC6

1 Introduction

This document lists the changes released to TFE02 environment from December 2024 and onwards. These changes will include both descriptions of fixes for known issues, and descriptions of any new features.

The content will be presented with the most current issues and fixes at the beginning of these release notes, while the oldest issues and fixes will be found at the end of these release notes. Each bug fix is annotated with a reference number, as well as a Remedy case number if it is relevant for the bug fix.

2 Release 6.1.5.2-RC6

Environment	Release date
PROD	N/A
TFE02	25-04-2025

2.1   Missing Mandatory Field Indicators in I2 EIDR Declaration Forms

Ref: FT-36524	
Description	Users were unable to identify which fields were mandatory when creating I2 EIDR declarations in TP UI, despite requirements specifying that mandatory fields should be clearly marked.
Fix	The issue was resolved by updating the UI configuration to properly display mandatory field indicators for all required data elements in the I2 EIDR declaration forms.
Impact	Users can now clearly identify which fields are mandatory when creating I2 EIDR declarations, improving form completion accuracy and reducing submission errors.

2.2   H1 Declaration with Missing Supporting Documents on Multiple Goods Items Incorrectly Accepted

Ref: FT-36493	
Description	The system was accepting H1 declarations with multiple goods items where only one item had the required supporting document reference to codelist 10282 GRN (99 03 069 000) = 1782, instead of requiring the reference on all goods items or at the declaration level.
Fix	The validation rules were updated to properly enforce the requirement that supporting documents must be consistently applied across all goods items or appropriately placed at the declaration level.
Impact	The system now correctly validates H1 declarations with multiple goods items, ensuring that supporting document references are properly applied according to business rules, which improves data integrity and compliance with customs requirements.

2.3   Incorrect Goods Item Status in G4 Declaration Consumptions View

Ref: FT-36456	
Description	When a G4 declaration with multiple goods items reached the "Goods Released" status, only the first goods item was

	correctly displayed with status "Ready for Consumption" in the Consumptions view, while all other goods items remained in "Accepted" status.
Fix	The system was updated to properly propagate the "Ready for Consumption" status to all goods items when a G4 declaration reaches the "Goods Released" status.
Impact	Users can now correctly view the status of all goods items in G4 declarations, ensuring accurate tracking of goods items that are ready for consumption and eliminating confusion caused by inconsistent status displays.

2.4 Missing Importer Information in CERTEX IES005 Requests for OSD Certificates

Ref: FT-36425	
Description	When processing declarations with OSD certificates (document type L100), the system was not including the importer information in the IES005 request to CERTEX, despite this information being present in the declaration, resulting in error C3416 being returned.
Fix	The system was updated to correctly extract and include importer information in IES005 requests to CERTEX when processing declarations with OSD certificates (L100).
Impact	Declarations with OSD certificates now process correctly without triggering the C3416 error, allowing for smooth validation of these certificates and preventing unnecessary processing delays for traders.

2.5 Invalid Document IDs Causing System Errors Instead of Proper Rejection

Ref: FT-36405	
Description	When declarations contained ODS certificate references with non-numeric identifiers (such as "Test0001"), the system would throw an exception in the certificate handler instead of properly rejecting the declaration, causing it to become stuck in validation.
Fix	The validation process was updated to properly validate document identifiers for ODS certificates and return appropriate rejection messages when the format is incorrect, rather than throwing system exceptions.
Impact	The system now correctly handles invalid document identifiers by providing clear rejection messages to users, preventing declarations from becoming stuck in validation and

improving the overall user experience when working with ODS certificates.

2.6   Error Message Structure Not Matching XSD Schema

Ref: FT-36391	
Description	The structure of error messages returned by the system when a declaration failed validation did not match the corresponding XSD schema, making it impossible for Economic Operators to properly serialize and process the responses they received from DMS.
Fix	The error message structure was updated to comply with the defined XSD schema, ensuring that all error responses follow the expected format for proper serialization.
Impact	Economic Operators can now properly parse and process error messages returned by the system, allowing for better error handling in their systems and improving the overall integration experience with DMS.

2.7   Circular Validation Errors for H7 Declarations with Procedure Code 40 00/F48

Ref: FT-36366	
Description	Users encountered a circular validation scenario when submitting H7 declarations with procedure code 40 00/F48, where the system first rejected the declaration requiring additional fiscal reference data, but then rejected it again after adding the required data with a contradictory error message.
Fix	The validation rules and error messages were updated to clearly indicate that both procedure codes C07 and F48 must be declared together when using additional fiscal reference FR5, eliminating the contradictory validation messages.
Impact	Users can now successfully submit H7 declarations with the correct combination of procedure codes and fiscal references without encountering circular validation errors, improving the declaration submission experience.

2.8   Missing Digit in Previous Procedure Code for I2EIDR Declarations

Ref: FT-36359	
Description	When uploading an I2EIDR declaration in the Trader Portal UI, the system was incorrectly handling the previous

	procedure code, resulting in one digit being removed (from "00" to "0"), causing the declaration to be rejected with error DMS12056.
Fix	The system was updated to correctly maintain all digits in the previous procedure code when processing I2EIDR declarations, ensuring proper mapping between the UI input and the submitted XML.
Impact	Users can now successfully submit I2EIDR declarations with correct procedure codes without experiencing rejections due to truncated procedure code values, enabling proper processing of supplementary declarations.

2.9   Missing Validation Details for CERTEX Certificate Rejections

Ref: FT-36353	
Description	When a declaration was rejected due to CERTEX certificate validation issues, the system was not displaying detailed validation information in the Validation Results, showing only three hyphens after Code, Text, and Information Type instead of the specific error details.
Fix	The system was updated to properly display complete validation information for CERTEX certificate rejections, including specific field references and detailed descriptions of the validation errors.
Impact	Users now receive clear and detailed information about CERTEX certificate validation failures, enabling them to quickly identify and correct issues with supporting documents, improving the overall declaration submission experience.

2.10 Language Selection Not Affecting Dropdown Content in Declaration Forms

Ref: FT-36329	
Description	When users changed the language setting (between English and Danish) while creating or editing a declaration in both Trader Portal, the dropdown menus continued to display values in the previously selected language instead of updating to the newly selected language.
Fix	The system was updated to properly refresh dropdown content when the language is changed, ensuring that all dropdown values are displayed in the currently selected language.

Impact	Users can now seamlessly switch between languages while working on declarations, with all dropdown menus correctly displaying values in their chosen language, providing a consistent and user-friendly experience across the system.

2.11 G3 Declarations Stuck in "Accepted" Status Without Proper Feedback

Ref: FT-36327	
Description	When submitting G3 declarations through Trader Portal to present goods on a G4 declaration, the G3 would remain stuck in "Accepted" status without either progressing to present the goods or providing rejection feedback, leaving users uncertain about the status of their declaration.
Fix	The system was updated to properly validate G3 declarations that reference G4 declarations, specifically checking for the correct previous document type code (N337 instead of NMRN), and providing clear rejection messages when validation fails.
Impact	Users now receive appropriate feedback when submitting G3 declarations, either seeing successful goods presentation for their G4 declarations or receiving clear rejection messages explaining what needs to be corrected, eliminating declarations getting stuck.

2.12 Missing Discharge History in Trader Portal for G4/G4G3 Declarations

Ref: FT-36319	
Description	When goods were discharged from Goods Accounting for G4 or G4G3 declarations, the discharge history was not displayed in the Trader Portal (TP) interface under the "History of Discharges" section in the Consumptions tab.
Fix	The system was updated to properly display discharge history information in the Trader Portal interface.
Impact	Traders can now view complete discharge history information for their G4 and G4G3 declarations directly in the Trader Portal, providing a more transparent view of goods movement through the customs process.

2.13 Amount Field (99 03 071) Not Displaying During Declaration Amendment

Ref: FT-36315	
Description	When attempting to amend a declaration that included data element 99 03 071 (Amount), the previously entered value was not displayed in the Trader Portal, making it impossible for users to view or modify the amount.
Fix	The system was updated to properly map and display the value of data element 99 03 071 (Amount) during declaration amendments in the Trader Portal.
Impact	Users can now view and modify amount values (99 03 071) when amending declarations, ensuring complete access to all declaration data during the amendment process and preventing potential errors or omissions in amended declarations.

2.14 Missing Values When Editing Data Element 14 03 040 014

Ref: FT-36314	
Description	When attempting to edit a declaration in Trader Portal, the values for data element 14 03 040 014 (Preference-related information) were not displayed in the edit view, despite being present in the declaration.
Fix	The system was updated to properly display existing values for data element 14 03 040 014 when editing declarations in the Trader Portal.
Impact	Users can now see and modify existing preference-related information when editing declarations, ensuring accurate updates and preventing accidental removal of important preference data during the editing process.

2.15 Unable to Delete Quota Order Number in Data Element 99 01

Ref: FT-36312	
Description	When attempting to correct a rejected declaration by removing the value in data element 99 01 (Quota Order Number), the system did not properly process the deletion, and the value remained present in the declaration even after submission.
Fix	The system was updated to properly handle deletion requests for data element 99 01 (Quota Order Number), ensuring that

	when users remove this value, it is actually deleted from the declaration.
Impact	Users can now successfully remove quota order numbers when correcting rejected declarations, allowing for proper modifications to declarations without unwanted data persisting after deletion attempts.

2.16 Incorrect House Consignment Numbering in G4G3 Declarations

Ref: FT-36311	
Description	In G4G3 declarations with multiple consignments, the House Consignment numbering started with "2" instead of the expected "1", causing inconsistent and confusing sequence numbering in the declaration structure.
Fix	The system was updated to correctly assign sequential numbering to House Consignments, ensuring that the first House Consignment starts with number "1" in accordance with the expected sequencing pattern.
Impact	Users now see consistent and logical numbering of consignments in G4G3 declarations, with House Consignments properly starting at "1", improving clarity and reducing confusion when working with complex multi-consignment declarations.

2.17 Supplement Rejections Due to Invalid BR667 Validation

Ref: FT-36309	
Description	When attempting to supplement an I1 declaration that had reached "Goods Released" status, the supplement request was being rejected with error BR667 (DMS10020) mentioning model version issues, despite all required fields being filled correctly, and the error message was not helpful in identifying the actual problem.
Fix	The system was updated to prevent the incorrect triggering of business rule BR667 during supplement submissions and to provide more descriptive error messages when validation issues occur.
Impact	Users can now successfully submit supplement requests for I1 declarations without encountering invalid BR667 rejections, enabling proper completion of the supplementary declaration process and ensuring accurate customs duty calculations.

2.18 Missing Validation for Mandatory Data Element 14 05 000 000

Ref: FT-36297	
Description	The system was accepting H1 declarations without the mandatory data element 14 05 000 000 (Invoice Amount), but then failing later when users attempted to submit an I2GPR (Goods Presentation Notification) related to these declarations, causing workflow disruptions.
Fix	The system validation was updated to properly check for the presence of data element 14 05 000 000 (Invoice Amount) during the initial H1 declaration submission, preventing declarations with missing mandatory data from being accepted.
Impact	Users now receive immediate validation feedback when submitting H1 declarations with missing invoice amount information, allowing them to correct the issue at the appropriate point in the workflow rather than encountering failures later during goods presentation.

2.19 B1 Declarations Rejected Without Clear Error Messages

Ref: FT-36259	
Description	When submitting B1 declarations after an H3 declaration and I2GPR (Goods Presentation), the B1 declarations were being rejected without providing any specific error message or reason for the rejection, leaving users unable to understand what needed correction.
Fix	The system was updated to properly display validation errors for rejected B1 declarations, specifically showing the missing additional code error messages (DK11026) that were previously being captured in the system but not displayed to users.
Impact	Users now receive clear error messages when B1 declarations are rejected, allowing them to identify and correct issues such as missing additional codes, improving the overall declaration submission experience and reducing frustration from unexplained rejections.

2.20 Missing Gross Mass Validation for H1 IMA and IMD Declarations in B2B Channel

Ref: FT-36253	
Description	When submitting H1 IMA and H1 IMD declarations through the B2B channel, the system was not enforcing the business rule that requires the gross mass at declaration level to be

	specified and approximately equal to the sum of gross mass values at the goods item level.
Fix	The validation rules were updated to properly enforce gross mass requirements across all submission channels, ensuring that H1 IMA and H1 IMD declarations submitted via B2B are validated for the presence of declaration-level gross mass that matches the sum of goods item-level values.
Impact	The system now maintains consistent validation across all submission channels, preventing incomplete declarations from being accepted and ensuring data integrity by requiring declaration-level gross mass to be properly specified on H1 IMA and IMD declarations.

2.21 H1 Declarations Getting Stuck in Validation When Submitted via Trader Portal

Ref: FT-36251	
Description	When submitting H1 declarations through the Trader Portal that contained Additional Fiscal References (data element 13 16 000 000) with foreign EORI numbers, the declarations would become stuck in the validation stage for up to an hour.
Fix	The system was updated to correct an error in the VIES (VAT Information Exchange System) validation process that was failing to return responses for foreign EORI numbers in the Additional Fiscal References field, causing the system to wait for the maximum timeout period (1 hour) before proceeding.
Impact	H1 declarations with foreign EORI numbers in Additional Fiscal References now process normally through validation without delays, significantly improving the user experience by eliminating the lengthy wait times previously encountered.

2.22 Missing 10 DKK National Guarantee Fee in H2 CWMTAX Notifications

Ref: FT-36246	
Description	When an H2 declaration triggered a national guarantee, the system correctly charged the 10 DKK fee, but this fee was not being included in the CWMTAX notification sent to the trader, making it impossible for them to see the complete customs debt information.
Fix	The system was updated to properly include the 10 DKK national guarantee fee in the CWMTAX notifications for H2 declarations when this fee is applied.

Impact	Traders now receive complete and accurate customs debt information in CWMTAX notifications for H2 declarations that trigger national guarantees, including the 10 DKK fee, providing transparency about all charges applied to their declarations.

2.23 Inconsistent Goods Item Status in G4G3 Consumption View

Ref: FT-36244	
Description	When a G4G3 declaration reached "Goods Released" status, only the first goods item would show "Ready for Consumption" status in the Consumptions tab, while all other goods items remained in "Accepted" status despite also being ready for consumption.
Fix	The business rules that determine goods item statuses in the Consumptions view were updated to correctly set all goods items to "Ready for Consumption" status when a G4G3 declaration reaches "Goods Released" status.
Impact	Users now see consistent and accurate status information for all goods items in the Consumptions view of G4G3 declarations, allowing for proper tracking and management of goods that are ready for consumption without having to rely on the overall declaration status.

2.24 Incorrect Quantity Left Display After Discharging All Goods from G4G3 Declaration

Ref: FT-36243	
Description	When discharging all goods from a G4G3 declaration, only the first goods item showed the correct Quantity Left value of 0, while all other goods items displayed negative values equal to their Initial Quantity, creating confusion about the actual remaining goods.
Fix	The calculation logic for Quantity Left values after discharge operations was corrected to properly set all goods items to 0 when fully discharged, regardless of their position in the declaration.
Impact	Users now see accurate Quantity Left values (0) for all goods items after performing a full discharge on G4G3 declarations, providing clear and consistent information about remaining goods quantities and preventing confusion caused by incorrect negative values.

2.25 G4 Declarations with C400 Documents Getting Stuck in Validation

Ref: FT-36239	
Description	When submitting G4 declarations through the Trader Portal that contained C400 supporting documents, the declarations would become stuck in "Received - Pending Validation" status indefinitely, with no manual acceptance task being created.
Fix	The system was updated to resolve an issue in the certificate handler (CERTEX) where business rule BR10191 was incorrectly attempting to access consignment shipment information in G4 declarations, which instead use master and house consignment structures, causing an index out of bounds exception.
Impact	G4 declarations containing C400 supporting documents now process correctly through validation without getting stuck, allowing users to successfully submit declarations with these document types and enabling the proper creation of manual acceptance tasks when required.

2.26 Amendments Adding F-GAS Certificates Not Being Processed

Ref: FT-36230	
Description	When amending H1 or H5 declarations to add F-GAS certificates (supporting document types Y986 or Y120) after the declaration had reached "Goods Released" status, the amendment would be received by the system but would not be further processed - neither accepted nor rejected.
Fix	The system was updated to properly handle amendments that add F-GAS certificates to existing declarations, ensuring that these amendments are fully processed through the validation workflow.
Impact	Users can now successfully amend declarations to add F-GAS certificates after goods release, with the amendments being properly processed and either accepted (leading to F-GAS certificate validation) or rejected with appropriate error messages, rather than being left in an unprocessed state.

2.27 H1 Declarations Getting Stuck in "Pending Validation" Status

Ref: FT-36206	
Description	H1 declarations submitted via B2B were getting stuck in "Received - Pending Validation" status and not progressing

	through the validation process, particularly when they contained foreign EORI numbers in the Additional Fiscal Reference field (13 16 000 000).
Fix	The system was updated to correct an error in the VIES (VAT Information Exchange System) validation process that was failing to return responses for declarations with foreign EORI numbers in the Additional Fiscal Reference field, causing the external validation process to wait for the full timeout period (1 hour).
Impact	H1 declarations with foreign EORI numbers in Additional Fiscal References now process correctly through validation without delays, improving processing times and preventing declarations from getting stuck in the validation stage.

2.28 G4 Annulment Not Sending Notifications or Updating Status

Ref: FT-36205	
Description	When a G4 Temporary Storage Declaration had its timer suspended or expired, the system was not properly annulling the declaration - it did not send the required notification to the person who lodged the declaration, and the declaration status was not updated to reflect the annulment.
Fix	The system was updated to correctly process G4 declaration annulments, ensuring that when a timer is suspended or expires, the declaration status is properly updated and the required notification is sent to the declarant through the same channel from which the declaration was received.
Impact	Users now receive proper notifications when their G4 declarations are annulled due to timer suspension or expiration, and the declaration status correctly reflects the annulment, improving transparency and communication throughout the temporary storage process.

2.29 Country of Dispatch Incorrectly Required for I1 Declarations

Ref: FT-36201	
Description	The system was incorrectly rejecting I1 declarations that did not include the Country of Dispatch code (data element 16 03 000 000), displaying an error message stating this field was mandatory, despite it being defined as conditional according to the specifications in FT-29474.
Fix	Business rule BR255 was updated to correctly implement the conditionality of the Country of Dispatch field for I1

	declarations, ensuring that it's only required when the specific conditions defined in DIAC-5754 are met.
Impact	Users can now successfully submit I1 declarations without the Country of Dispatch code when it's not required by the business conditions, preventing unnecessary rejections and aligning the system behavior with the official data element specifications.

2.30 Exporter Information Missing in Trader Portal View for I1 Declarations

Ref: FT-36182	
Description	When submitting I1 declarations with exporter information (data element 13 01 017) through B2B channels, the exporter data was not displayed in the Trader Portal.
Fix	The mapping between the backend data model and the Trader Portal interface was updated to correctly display exporter information for I1 declarations in the Trader Portal.
Impact	Users can now see complete declaration information, including exporter details, when viewing I1 declarations in the Trader Portal.

2.31 Unable to Process Repayment/Remission Authorizations (4C)

Ref: FT-36167	
Description	When attempting to create a Repayment/Remission Authorization (4C) through the Trader Portal for a declaration with goods released status, users encountered an error message: "java.lang.IllegalStateException: Expected BEGIN_OBJECT but was STRING at path $.repaymentRemissionAuthorisation.traderCommodityCode[0].nomenclatureCode (Code: OE5999)", preventing the processing of these authorizations.
Fix	The system was updated to correctly handle the data format for commodity codes in Repayment/Remission Authorizations, resolving the JSON parsing error that was occurring when users entered nomenclature codes.
Impact	Users can now successfully create and submit Repayment/Remission Authorization (4C) requests through the Trader Portal, allowing for proper processing of repayment and remission claims for duties paid on released goods.

2.32 XML File Upload Failure Without Useful Error Messages

Ref: FT-36142	
Description	When attempting to upload an XML file through the Trader Portal UI, the system would appear to be processing the file but would eventually fail without providing any useful error message to the user, leaving them unaware of why the upload was unsuccessful.
Fix	The system was updated to properly handle XML file upload failures by providing clear and descriptive error messages that explain the reason for rejection, allowing users to understand and address the issues with their XML files.
Impact	Users now receive meaningful error messages when uploading invalid XML files through the Trader Portal, improving the user experience by providing actionable feedback and reducing confusion about why uploads are failing.

2.33 Missing TARIC Code Identifier in PDF Export from Trader Portal

Ref: FT-36118	
Description	When exporting a declaration to PDF from the Trader Portal, the TARIC code Identifier (data element 18 09 058 000) was not being properly included in the PDF output, despite being visible in the Trader Portal interface, causing inconsistency between the online view and the exported document.
Fix	The PDF generation process was updated to correctly include the TARIC code Identifier (18 09 058 000) in the exported PDF documents, with proper formatting consistent with other data elements.
Impact	Users now receive complete and accurate PDF exports of their declarations from the Trader Portal, including the TARIC code Identifier with proper labeling, ensuring consistency between the online view and exported documents for record-keeping and compliance purposes.

2.34 Inconsistent Decimal Separator Display in Declaration Fields

Ref: FT-36107	
Description	When entering decimal values with comma separators in data elements 14 06 (Freight charges) and 14 09 (Adjustments), the system accepted the input correctly, but when viewing the submitted declaration, these values were displayed with

	period (.) decimal separators instead of commas, creating inconsistency in the user interface.
Fix	The system was updated to consistently display decimal values with comma separators in all views of the declaration, matching the Danish standard for decimal notation and ensuring consistency between input and display formats.
Impact	Users now see consistent decimal notation with comma separators throughout the system, eliminating confusion caused by different decimal separators being used in different views of the same declaration data.

2.35 Missing Procedure Code Descriptions in Trader Portal

Ref: FT-36101	
Description	In the Trader Portal interface, the dropdown elements for Requested Procedure (11 09 001 000) and Previous Procedure (11 09 002 000) fields initially displayed descriptions in parentheses, but the Additional Procedure (11 10 001 000) field lacked these descriptions. Additionally, after submitting a declaration, the descriptions disappeared for all procedure fields.
Fix	The system was updated to consistently display descriptive text for all procedure codes, including Additional Procedure codes (11 10 001 000), both during declaration creation and after submission, in the Trader Portal interface.
Impact	Users now have access to helpful descriptive text for all procedure codes throughout the declaration lifecycle, improving understanding of code meanings and reducing potential errors when selecting procedure codes.

2.36 Supplementary Unit Type Not Communicated to CERTEX from UI Submissions

Ref: FT-36061	
Description	When submitting declarations with supplementary unit information (data element 18 02 000 000) through the Trader Portal, the supplementary unit type was not being communicated to CERTEX, while the same declarations submitted through B2B channels correctly included this information. This caused CERTEX validation errors with message "CertificateDataDTO.consignmentItem.supportingDocument.measurementUnitCode is not compliant."

Fix	The system was updated to properly extract and include supplementary unit type information in CERTEX requests regardless of the submission channel used (UI or B2B), ensuring consistent handling of declarations.
Impact	Declarations with supplementary unit information can now be successfully submitted through all channels (TP, and B2B) without encountering CERTEX validation errors related to missing measurement unit codes, providing a consistent experience across all submission methods.

2.37 Item Charge Amount (14 08) Not Accepting Comma for Decimal Values

Ref: FT-36056	
Description	When entering decimal values in the Item Charge Amount field (data element 14 08 000 000) in Trader Portal, the system would not accept comma as a decimal separator, generating a parsing error: "Failed parsing '25000,65' as BigDecimal".
Fix	The system was updated to properly accept and process comma as a decimal separator for the Item Charge Amount field (14 08 000 000), aligning with Danish numerical notation standards.
Impact	Users can now enter decimal values using comma separators in the Item Charge Amount field, providing a consistent user experience across all numeric fields in the system and aligning with local numerical notation practices.

2.38 System Incorrectly Accepting Freight Charge Amount on H1 Declarations

Ref: FT-36045	
Description	The system was incorrectly allowing users to submit H1 declarations with freight charge amounts (data elements 14 15 014 000 and 14 15 012 000) specified, despite these elements being restricted to H7 declarations according to the EU Customs Data Model (EUCDM).
Fix	The system validation was updated to properly enforce data element restrictions according to the EUCDM, preventing the submission of H1 declarations containing freight charge amounts.
Impact	The system now correctly enforces data element rules for different declaration types, ensuring that H1 declarations without freight charge amounts are accepted while those with

	freight charge amounts are properly rejected, maintaining compliance with EUCDM specifications.

2.39 Blacklist Option Missing from Authorization Representation Type Selection

Ref: FT-35901	
Description	When attempting to create Authorization Representations in the Trader Portal, the "Blacklist" option was not available in the dropdown menu for Authorization type, despite being a required functionality for Economic Operators to indicate who cannot act as their representative.
Fix	The system was updated to correctly include the "Blacklist" option in the Authorization type dropdown menu by fixing the filtering method used to populate the dropdown values.
Impact	Economic Operators can now successfully create blacklist authorizations in the Trader Portal, allowing them to specify which representatives are not authorized to act on their behalf, thus improving security and control over representation relationships.

2.40 H1 IMD Declarations Rejected Despite Having Supplementary Units

Ref: FT-35805	
Description	When submitting H1 IMD declarations with specific commodity codes requiring supplementary units, the system was rejecting the declarations with error DK11103 (requiring supplementary units in data element 18 02 000 000) despite the field being correctly filled with values and unit type.
Fix	The system was updated to properly recognize and process supplementary unit information in H1 IMD declarations, particularly addressing the handling of measurement qualifiers and unit types required by TARIC for specific commodity codes.
Impact	Users can now successfully submit H1 IMD declarations with commodity codes requiring supplementary units without encountering false validation errors, ensuring proper processing of these declarations through both the Trader Portal and B2B channels.

2.41 Premature Goods Discharge Between G4G3 Declarations During Control

Ref: FT-35755	
Description	When submitting two G4G3 declarations where the second declaration was intended to discharge goods from the first, the system was incorrectly allowing the discharge to occur while the second declaration was still in the control phase (before risk analysis was completed), creating a risk that goods could be discharged by a declaration that might later be invalidated.
Fix	The system was updated to properly sequence discharge operations, ensuring that goods from one G4G3 declaration are only discharged by another G4G3 declaration after the discharging declaration has completed all control processes and risk analysis.
Impact	The discharge process now maintains proper sequencing and data integrity, preventing scenarios where goods might be discharged by declarations that are still under control or could potentially be invalidated, ensuring accurate tracking of goods throughout the customs process.

2.42 H1 IMZ Previous Document Validation Error for I2EIDR References

Ref: FT-35593	
Description	When attempting to create an H1 IMZ declaration that references both an H2 declaration and an I2EIDR declaration as previous documents, the system was rejecting the submission with an error related to the customs warehouse, preventing the proper discharge flow from H2 through I2EIDR to H1 IMZ.
Fix	Business rule BR_VALI_0101_98 was updated to accept '8' as a valid second-to-last character in the MRN of previous documents referenced in H1 IMZ declarations with customs warehouse information, allowing proper references to I2EIDR declarations (which have '8' in this position).
Impact	Users can now successfully submit H1 IMZ declarations that reference both H2 and I2EIDR declarations as previous documents, enabling the complete discharge flow from customs warehouse declarations through entry in declarant's records to supplementary declarations.

2.43 Missing and Incorrect English Texts in Multiple Codelists

Ref: FT-35477	
Description	During a review of the Danish user interface, several codelists (CL10027, CL10272, CL10275, CL11000, and CL10216) were found to contain issues with their English texts, including incorrect legal references, Danish text in English fields, and spelling mistakes.
Fix	The system was updated with corrected English texts for the affected codelists, particularly focusing on codes B01, F50, and F52 which were referenced in EU legislation but missing or incorrect in the system.
Impact	Users now see correct and consistent English text in dropdown menus throughout the system, improving clarity and ensuring that legal references are accurate, which is particularly important for users working in English or in multilingual environments.

2.44 Missing Error Reason in B1 Rejection After Export Already Completed

Ref: FT-35397	
Description	When attempting to submit a B1 export declaration using the same data after an export had already been completed in an H3/B1 flow, the system would reject the declaration but provide no reason for the rejection in the CWMREJ notification, making it difficult for users to understand why their submission was unsuccessful.
Fix	The system was updated to properly include detailed rejection reasons in the CWMREJ notification when a B1 declaration is rejected due to attempting to re-use the same data for goods that have already been exported, providing specific validation codes and explanatory text.
Impact	Users now receive clear and detailed rejection messages when attempting to submit duplicate B1 declarations, including information about goods not being available in Goods Accounting, enabling them to understand why their submissions are rejected and take appropriate corrective action.

2.45 Number Formatting Changing from Comma to Dot in Trader Portal

Ref: FT-34894	
Description	When entering decimal numbers with comma separators in data element 18 04 000 000 (Gross Mass) in the Trader Portal

	UI, the system was changing these to period separators after the declaration was submitted, creating inconsistency between the input format and the displayed format.
Fix	The system was updated to consistently maintain the comma as the decimal separator throughout the entire process in the Trader Portal UI when the language is set to Danish, preserving the user's input format in the displayed values after submission.
Impact	Users now experience consistent decimal notation with comma separators throughout the Trader Portal interface, eliminating confusion caused by automatic format changes and providing a more intuitive experience aligned with Danish numerical notation standards.

2.46 H5 Corrections Not Properly Displayed in Trader Portal

Ref: FT-34840	
Description	When submitting a correction (amendment) to an H5 declaration to add goods items, the Trader Portal interface was not displaying the correction correctly - instead of showing all goods items, it would duplicate the first goods item.
Fix	The Trader Portal interface was updated to correctly process and display H5 declaration amendments, ensuring that added goods items are properly shown as distinct items rather than duplicating existing ones.
Impact	Users can now accurately view the results of H5 declaration amendments in the Trader Portal interface, with all goods items correctly displayed ensuring accurate representation of declaration contents.

2.47 Premature Notification Sent During Two-Factor Approval Process

Ref: FT-34651	
Description	When processing an Invalidation and Repayment (INV4C) application requiring two-factor approval (for amounts over 2000 DKK), the system was incorrectly sending a notification to the Economic Operator after the first customs officer approved the application, suggesting that the application was approved, even though it still required approval from a second customs officer.
Fix	The system was updated to modify the notification message text for the first approval step to clearly indicate that the process is not yet complete, changing the message from "Manual Case handling completed" to "Manual Handling Processing

	Step Completed - Additional Steps Might Follow", preventing confusion about the application status.
Impact	Economic Operators now receive clearer notifications during the two-factor approval process, reducing confusion about whether their application has been fully approved and ensuring they understand that additional processing steps may be required before final approval.

2.48 Incorrect Validation for Supporting Documents with Guarantee Type 3

Ref: FT-34593	
Description	When submitting H1 declarations with guarantee type '3', the system was incorrectly rejecting them with an error message citing business rule BR372_041, which required a supporting document with type code 1782 from codelist 10282 for each goods item. Later versions changed the error message to reference BR10014_108, but the underlying issue remained the same.
Fix	The system validation was updated to correctly interpret the requirements for supporting documents when guarantee type '3' is used, removing the incorrect enforcement of business rule BR372_041/BR10014_108 that was requiring supporting documents with type code 1782 on each goods item.
Impact	Users can now successfully submit H1 declarations with guarantee type '3' without being required to include supporting documents with type code 1782 for each goods item, allowing for proper processing of these declarations and aligning the system behavior with the actual business requirements.

2.49 Incorrect Use of Customs Office of Presentation (D.E. 17 09) in H6/H7 Declarations

Ref: FT-31350	
Description	The system was incorrectly using data element 17 09 (Customs Office of Presentation) in H6 and H7 declaration types, despite this data element not being part of their official datasets according to EU legislation. According to note 22 to Annex B in Delegated Act (title 13), this field should only be used for centralized clearance scenarios.
Fix	The system was updated to remove data element 17 09 (Customs Office of Presentation) from the H6 and H7 declaration

	interfaces and processing logic, ensuring compliance with EU legislation regarding the proper use of this data element.
Impact	The system now correctly handles customs office information in H6 and H7 declarations without using the data element reserved for centralized clearance, ensuring legal compliance with EU customs regulations and preventing potential issues when the Centralized Clearance for Import (CCI) is implemented.

3 Release 6.1.5.2-RC5

Environment	Release date
PROD	N/A
TFE02	09-04-2025

3.1   Failed TARIC validation not triggering error in H4 declarations

Ref: FT-36350	
Description	When TARIC validation failed for an H4 declaration, the system continued processing without throwing an error, resulting in customs duty and VAT being incorrectly calculated as zero.
Fix	The system was updated to properly handle TARIC validation failures by throwing appropriate errors when validation responses indicate problems, preventing incorrect zero-value tax calculations.
Impact	The system now correctly identifies and reports TARIC validation failures in H4 declarations.

3.2   Incorrect data element DE 12 04 001 appearing in G4 declarations

Ref: FT-36343	
Description	Data element 12 04 001 (Additional Document Reference) was incorrectly appearing in G4 declarations at Master Item and House Consignment levels in Trader Portal, despite this element not existing for G4 declarations according to the EU Customs Data Model (EUCDM).
Fix	The system was updated to remove the incorrect data element 12 04 001 from G4 declaration forms in the user interface.
Impact	G4 declarations now correctly align with the EUCDM specifications.

3.3   Consignor EORI incorrectly required in G4 declarations

Ref: FT-36320	
Description	When submitting a G4 declaration, the system was incorrectly requiring a consignor EORI number despite this being defined as an optional data element in the requirements documentation for G4 declarations.
Fix	The validation rules were updated to correctly treat the consignor EORI as optional for G4 declarations, aligning with the specifications.

Impact	Users can now submit G4 declarations without providing a consignor EORI number when this information is not available.

3.4 Unable to manually create H4 declarations due to goods item number error

Ref: FT-36313	
Description	When manually creating an H4 declaration in Trader Portal, users encountered an error related to the goods item number field, which is a locked data element that cannot be modified by the user, preventing successful submission of the declaration
Fix	The system was updated to properly handle goods item numbering for manually created H4 declarations, resolving the validation error with the locked field.
Impact	Users can now successfully create and submit H4 declarations manually in Trader Portal without encountering blocking errors related to goods item numbering.

3.5 G4 declarations not entering goods accounting when presented by G3

Ref: FT-36298 , PSD-10767	
Description	When a G4 declaration was presented by a G3 declaration, the goods were not being placed into goods accounting after the G4 had gone through risk assessment and control, causing the declaration to not reach "goods released" status and preventing visibility of the goods in the user interface.
Fix	The error handling in the goods accounting and preclearance components was fixed to properly process G4 declarations when they are presented by G3 declarations.
Impact	G4 declarations presented by G3 declarations now correctly enter goods accounting and reach "goods released" status

3.6 Goods items not displaying in Trader Portal view

Ref: FT-36276	
Description	After submitting an H2 declaration with goods items through Trader Portal, the goods items section appeared empty when viewing the declaration.
Fix	The system was updated to properly display goods items in the Trader Portal interface after declaration submission.

Impact	Users can now view all goods items in their declarations through the Trader Portal interface.

3.7 Missing error explanation for H1 IMZ declarations

Ref: FT-36266	
Description	When submitting an H1 IMZ declaration that failed validation with error code BR_VALI_0601_01, no explanation was provided in the rejection message, preventing users from understanding how to resolve the issue.
Fix	The system was updated to include proper validation information for BR_VALI_0601_01 errors, with descriptive text added and the validation text improved to be more informative.
Impact	Users now receive clear explanations when H1 IMZ declarations are rejected due to BR_VALI_0601_01 validation failures.

3.8 CERTEX integration error when submitting Transit declarations with C640 supporting document

Ref: FT-36264, PSD-10591	
Description	When submitting a T1 Transit declaration with supporting document type C640 (ODS - Ozone Depleting Substances), users encountered error C3361 preventing successful CERTEX integration.
Fix	The system was updated to properly process Transit declarations containing C640 supporting documents in the CERTEX integration flow.
Impact	Users can now successfully submit Transit declarations that include C640 supporting documents for ODS certificates.

3.9 Missing Previous Document ID field in I2EIDR declarations

Ref: FT-36250	
Description	When submitting or viewing I2EIDR declarations in Trader Portal, the Previous Document ID field (12 01 001) was missing from both the creation form and the declaration view, preventing users from entering or editing important reference information such as dates or MRNs for previous documents.
Fix	The forms for simplified declarations were updated to include the Previous Document ID field (12 01 001) in Trader Portal.

Impact	Users can now properly view and edit Previous Document ID information when creating or modifying I2EIDR declarations.

3.10 Incorrect tab structure in Goods Registration Entry amendment view

Ref: FT-36245	
Description	When amending a Goods Registration Entry (GRE) in Trader Portal, an unnecessary "Overview" tab appeared in the amendment submission view, containing groups 11, 18, and 19.
Fix	The form configuration for GRE amendments was updated to remove the incorrect "Overview" tab and properly organize all fields in their appropriate sections.
Impact	Users now experience a consistent and properly structured interface when amending Goods Registration Entries in Trader Portal.

3.11 H5 declarations with procedure code 40 incorrectly rejected during goods presentation

Ref: FT-36241, PSD-10744	
Description	When submitting a Goods Presentation Request (GPR) for an H5 declaration with procedure code 40 00 F15, the system incorrectly rejected it with error DMS12056, indicating that procedure code 40 was not allowed, despite this being a valid combination according to requirements.
Fix	The system was updated to correctly handle H5 declarations with procedure code 40 during the goods presentation process by preventing the automatic addition of application fields to the payload when submitted through Trader Portal.
Impact	Users can now successfully present goods for H5 declarations with procedure code 40 00 F15

3.12 H7 invalidation requests with reason code 125 not automatically accepted

Ref: FT-36235	
Description	After a modification of invalidation reason codes, H7 invalidation requests with reason code 125 (previously code 25) were no longer being automatically accepted.
Fix	The business rule BR_ADDM_0202_DetermineAutomaticProcessingOfInvalidationApplications was updated to recognize reason code 125 for automatic processing of H7

	invalidation requests, and the corresponding validation against codelist CL50006 was adjusted.
Impact	H7 invalidation requests with reason code 125 are now correctly processed automatically.

3.13 Missing communication fields in G5 declarations at House Consignment level

Ref: FT-36227	
Description	Data elements 13 02 029 and 13 03 029 (communication fields) were missing at the House Consignment level in G5 declarations in Trader Portal, despite being required according to the EU Customs Data Model (EUCDM).
Fix	The G5_TP_HouseConsignmentItem form was updated to include the missing data elements 13 02 029 and 13 03 029 at the House Consignment level.
Impact	G5 declarations now correctly display and allow entry of communication information at the House Consignment level.

3.14 No consumptions visible for G4 declarations after goods presentation

Ref: FT-36222, PSD-10696	
Description	After presenting a G4 declaration with a G3 declaration, no goods were available for consumption in the Consumptions tab.
Fix	The system was updated to properly register goods for consumption after a G4 declaration is presented with a G3 declaration.
Impact	Users can now see and manage available goods for consumption after presenting G4 declarations with G3 declarations.

3.15 Missing 90-day timer for G4 declarations after goods presentation

Ref: FT-36221, PSD-10701	
Description	After presenting a G4 declaration with a G3 declaration and reaching "Release of Goods" status, the system was not starting the required 90-day timer for the temporary storage period.
Fix	The system was updated to properly initiate the 90-day timer for G4 declarations after goods presentation with G3 declarations.

Impact	The 90-day temporary storage period is now correctly tracked for G4 declarations

3.16 Control status not updated in DMS despite red risk assessment in KRIA

Ref: FT-36203, PSD-10699	
Description	When a declaration received a "Red" risk assessment in KRIA, the control status in DMS was incorrectly showing as "No Control" instead of "Intention of Control", preventing proper control processing.
Fix	The system was updated to properly process risk assessment results from KRIA and correctly update the control status in DMS when a red risk assessment is confirmed.
Impact	Declarations that receive red risk assessments in KRIA now correctly show "Intention of Control" status in DMS

3.17 Unable to upload requested additional documents for Transit declarations in Trader Portal

Ref: FT-36186, PSD-10656	
Description	When additional information was requested during control in KRIA for a Transit declaration, traders were unable to upload the requested documents in Trader Portal due to the declaration status not updating properly (remaining in "Pre-lodged" or "Under control" instead of changing to "Enquiry for additional information").
Fix	The system was updated to correctly update the status of Transit declarations in Trader Portal when additional information is requested during control, enabling document uploads.
Impact	Traders can now successfully upload additional documents requested during control of Transit declarations through the Trader Portal interface.

3.18 Royalties and license fees (AI) not included in VAT calculation

Ref: FT-36153, PSD-10644	
Description	When submitting an H1 declaration with addition code AI (royalties and license fees) along with deduction codes BB and BD, the AI amount was not being included in the VAT calculation base because it was missing from codelist 10254.

Fix	Addition code AI (royalties and license fees) was added to codelist 10254 to ensure it is properly included in VAT calculations.
Impact	VAT calculations now correctly include amounts for royalties and license fees (addition code AI) in the calculation base.

3.19 White screen error when correcting rejected H2 declarations with no goods items

Ref: FT-36127, PSD-10639	
Description	When attempting to correct a rejected H2 declaration that was manually created without any goods items in Trader Portal, users encountered a white screen error with URL redirecting to the additional-message page.
Fix	The system was updated to properly handle the correction of rejected declarations that have no goods items, preventing the white screen error.
Impact	Users can now successfully correct rejected H2 declarations that were submitted without goods items, improving the overall usability and error handling of the Trader Portal interface.

3.20 Unable to properly amend Guarantee group (99 02) information

Ref: FT-36113, PSD-10605	
Description	When submitting an amendment request to modify guarantee information in a declaration, only the Guarantee Type Code was being updated while other guarantee reference elements were not being removed as requested, and the changes were not reflected in the Trader Portal UI.
Fix	The amendment processing was updated to properly handle changes to all elements in the Guarantee group (99 02), including the removal of guarantee reference elements when requested.
Impact	Users can now successfully amend all guarantee information in declarations, with changes properly reflected in the TP interface.

3.21 Incorrect version number displayed in website footer

Ref: FT-36112, PSD-10606	

Description	The footer on the Trader Portal interface was displaying version 6.1.5.1 despite the system being updated to version 6.1.5.2.
Fix	The footer components in all user interfaces were updated to correctly display the current version number 6.1.5.2
Impact	All system interfaces now display the correct version number in their footers

3.22 Unable to upload extra attachments to G4G3 declarations in Trader Portal

Ref: FT-36110, PSD-10595	
Description	When attempting to upload an extra attachment to a G4G3 declaration in Trader Portal, the user interface did not respond to the submission action, preventing the document from being uploaded and displayed in the Documents tab.
Fix	The system was updated to properly process extra attachment uploads for G4G3 declarations in Trader Portal.
Impact	Users can now successfully upload and view extra attachments for G4G3 declarations through the Trader Portal interface.

3.23 Missing validation for procedure code C07 price limit in H1 declarations

Ref: FT-36090	
Description	When submitting an H1 declaration with additional procedure code C07, the system was not validating that the price of goods must not exceed 1150 DKK (approximately 150 EUR), allowing declarations with higher prices to be accepted.
Fix	A validation rule was implemented to enforce the price limit of 1150 DKK for declarations with additional procedure code C07, ensuring compliance with the requirements specified in the EU Customs Data Model guidance.
Impact	The system now correctly rejects H1 declarations with additional procedure code C07 when the goods value exceeds 1150 DKK.

3.24 H1 declarations incorrectly transforming to H7 with procedure code C08

Ref: FT-36089, PSD-10629	
Description	When submitting an H1 declaration with additional procedure code C08 in data element 11 10 000 000, the system incorrectly transformed it to an H7 declaration, causing elements to be lost including the price of goods (14 08 000 000), which allowed declarations with goods of any price to be submitted.
Fix	The system was updated to prevent the incorrect transformation of H1 declarations to H7 when additional procedure code C08 is used, and a validation was implemented to enforce the price limit of 360 DKK (approximately 45 EUR) for goods with this procedure code.
Impact	H1 declarations with additional procedure code C08 now remain as H1 declarations and are properly validated against the maximum allowed price limit.

3.25 IOSS identifier corrections not displayed in Trader Portal for H7 declarations

Ref: FT-36084 , PSD-10588	
Description	When correcting an invalid IOSS identifier (13 16 034 000) in an H7 declaration through Trader Portal, the correction appeared to be accepted based on the success message, but the updated value was not displayed in the interface, leading to a rejection during goods presentation.
Fix	The system was updated to properly display corrected IOSS identifier values in the Trader Portal interface after a successful correction.
Impact	Users can now see the corrected IOSS identifier values in Trader Portal after making corrections.

3.26 UI incorrectly marking decimal values as invalid in exchange rate and invoice amount fields

Ref: FT-36081, PSD-10608	
Description	When entering decimal values in data elements 14 09 001 (Exchange Rate) or 14 06 001 (Total Amount Invoiced) using either a comma or period separator, the input field would turn

	red and display an error message suggesting the value was invalid, despite the system actually accepting the value.
Fix	The UI validation was updated to properly recognize and visually accept decimal values in the Exchange Rate and Total Amount Invoiced fields.
Impact	Users can now enter decimal values in these fields without receiving misleading error indicators.

3.27 Unable to discharge G4G3 declarations using H1 declarations

Ref: FT-36041	
Description	When attempting to discharge goods from a G4G3 declaration using an H1 declaration with previous document type N337, the system incorrectly rejected the H1 declaration with error DK1287 / BR_VALI_0101_98, preventing proper discharge of temporary storage goods.
Fix	The validation rule was updated to properly recognize and process H1 declarations that reference G4G3 declarations with previous document type N337, enabling successful discharge of goods from temporary storage.
Impact	Users can now successfully discharge goods from G4G3 declarations using H1 declarations with previous document type N337

3.28 Incorrect validation error message for procedure code C08

Ref: FT-36017	
Description	When submitting an H7 declaration with additional procedure code C08 that exceeded the allowed value limit, the validation error message incorrectly stated "Total declared customs value plus postal charges should be less than 45 EUR or less than 335 DKK for declaration procedure category H7" instead of referencing the specific procedure code C08.
Fix	The validation error message was updated to correctly state "Total declared customs value plus postal charges should be less than 45 EUR or less than 335 DKK for additional procedure code C08".
Impact	Users now receive more accurate and specific validation error messages when submitting declarations with procedure code C08 that exceed the value limit.

3.29 Declarations getting stuck in validation with incomplete payment information

Ref: FT-35968, PSD-10709	
Description	When submitting declarations with incomplete payment information in data element 14 03, specifically providing a payable amount value without the required measurement unit type, the declarations would get stuck in "Pending Validation" status rather than being properly rejected.
Fix	The validation logic in business rule BR255_076 was updated to properly handle null pointer scenarios when checking payment information, ensuring declarations with incomplete payment data are properly rejected.
Impact	Declarations with incomplete payment information are now properly rejected with appropriate validation messages rather than getting stuck in the validation process

3.30 Dropdown list failure causing page scrolling to be disabled

Ref: FT-35937, PSD-10451	
Description	When removing an element from a dropdown list by clicking the X button, the dropdown list would occasionally fail to reload while still disabling the page scrollbar, making the page appear frozen or stuck without providing users a clear way to exit this state.
Fix	The system was updated to properly handle dropdown list reload failures, ensuring that either the dropdown list loads correctly or the page scrollbar is re-enabled if loading fails.
Impact	Users no longer experience "frozen" pages when dropdown lists fail to load.

3.31 Incorrect goods item number assigned to house consignment level in G4G3 declarations

Ref: FT-35913, PSD-10442	
Description	In G4G3 declarations, the system was incorrectly assigning goods item number 2 to the house consignment level, despite this being an overall level rather than an actual goods item, causing issues when attempting to re-export goods with A3 declarations from G4G3 declarations with multiple master consignment items.

Fix	The system was updated to correctly handle the hierarchical structure of G4G3 declarations, ensuring goods item numbers are only assigned to actual goods items and not to house consignment levels.
Impact	Users can now properly process G4G3 declarations with multiple master consignment items and successfully create A3 declarations for re-export of goods

3.32 System allowing negative values in data element 14 04 014

Ref: FT-35887, PSD-10433	
Description	When manually creating declarations in Trader Portal, users could enter negative values in data element 14 04 014 (additions and deductions) by using the down arrow or scroll function, despite this field only accepting positive values according to the EU Customs Data Model.
Fix	The system was updated to prevent entry of negative values in data element 14 04 014, ensuring only valid positive numbers can be entered.
Impact	Users can no longer accidentally enter invalid negative values in additions and deductions fields.

3.33 Incorrect warehouse identifier requirement when discharging G4 declarations

Ref: FT-35882, PSD-10435	
Description	When submitting an H1 declaration to discharge goods from a G4 (temporary storage) declaration using previous document type code N337, the system incorrectly required a customs warehouse identifier (D.E. 12 11 015 000).
Fix	The business rule BR10014_020_1 was updated to no longer require the warehouse identifier when discharging G4 declarations with H1 declarations.
Impact	Users can now successfully discharge goods from G4 (temporary storage) declarations using H1 declarations with previous document type code N337 without needing to provide a warehouse identifier.

3.34 Incorrect control status for standard declarations after risk assessment

Ref: FT-35868, PSD-10417	

Description	Standard declarations (such as H7 IMA) were incorrectly receiving the status "Intention of Physical Inspection of Goods" after risk assessment indicated control was needed, despite this status being appropriate only for pre-lodged declarations.
Fix	The system was updated to properly assign the status "Under Control" rather than "Intention of Physical Inspection of Goods" to standard declarations
Impact	Standard declarations now correctly display "Under Control" status in both Trader Portal and Customs Web Manager interfaces after risk assessment indicates control is needed

3.35 Missing Goods Accounting functionality for Temporary Storage declarations

Ref: FT-35863, PSD-10641	
Description	The Goods Accounting functionality was not enabled for G5 (Temporary Storage) declarations, preventing users from viewing and managing goods accounting information for these declarations.
Fix	The system was updated to enable the Goods Accounting functionality for G5 declarations, making the Consumptions tab visible in Trader Portal.
Impact	Users can now access and use Goods Accounting functionality for G5 declarations, allowing proper tracking and management of goods in temporary storage.

3.36 System exception when processing declarations with net weight exceeding 8 digits

Ref: FT-35818	
Description	When processing declarations with net weight or gross mass values greater than 8 digits (but within the system limit of 10 digits), the system would throw an exception during the "Inform Goods Accounting" step, causing declarations to become stuck in "Final customs debt covered" status without progressing to "Clearance provided".
Fix	The system was updated to properly handle the discrepancy between the general system limit (10 digits) and the quota system limit (8 digits) for weight values.
Impact	Declarations with net weight or gross mass values between 8 and 10 digits now correctly progress through the clearance flow to "Clearance provided" status.

3.37 Missing mandatory field indicators in I1 declarations on Trader Portal

Ref: FT-35682	
Description	Mandatory data elements for I1 declarations were not visually marked with indicators in the Trader Portal interface, making it difficult for users to identify which fields must be completed.
Fix	The system was updated to correctly mark all mandatory data elements for I1 declarations according to the requirements specifie, using asterisk (*) indicators.
Impact	Users can now clearly identify all mandatory data elements when creating I1 declarations in Trader Portal.

3.38 Missing mandatory field indicators in H2 declarations on Trader Portal

Ref: FT-35676	
Description	Mandatory data elements for H2 declarations were not visually marked with indicators in the Trader Portal interface, making it difficult for users to identify which fields must be completed.
Fix	The system was updated to correctly mark all mandatory data elements for H2 declarations according to the requirements specified, including the Goods Reference field (19 07 44).
Impact	Users can now clearly identify all mandatory data elements when creating H2 declarations in Trader Portal.

3.39 Misleading error messages for XML element order validation

Ref: FT-35672, PSD-10279	
Description	When submitting declarations with elements in incorrect order through the v2 endpoint, the system returned misleading error messages such as "ELEMENT PATH: Value is required" or "Unknown validation error", making it difficult for users to identify and fix the actual issue with element ordering.
Fix	The validation error messages were improved to clearly indicate when an element is out of order in the XML structure, providing more specific information about which element is causing the issue and where it should be placed.
Impact	Users now receive clearer and more helpful error messages when submitting declarations with incorrect element ordering

3.40 Incorrect distribution of declaration-level additions and deductions

Ref: FT-35666, PSD-10593	
Description	When additions or deductions were declared at the declaration level, they were incorrectly distributed among goods, with 87% of the value disappearing entirely instead of being properly distributed.
Fix	The system was updated to properly distribute declaration-level additions and deductions among goods items based on either gross mass or item value, depending on the addition type as specified in codelist 10244.
Impact	Declaration-level additions and deductions are now correctly distributed among goods items.

3.41 Incorrect national codes appearing in INV4c form dropdown menu

Ref: FT-35645, PSD-10313	
Description	When creating an repayment/remission request, the dropdown menu for data element VIII/8 - DE 48 08 000 302 incorrectly displayed test national codes despite there being no national codes for repayment/remission in Denmark.
Fix	The system was updated to remove the incorrect test national codes from the dropdown menu in the INV4c form.
Impact	Users creating repayment/remission requests now see only valid options in the dropdown menu.

3.42 Missing data elements in supporting documents section at goods item level

Ref: FT-35070, PSD-10225	
Description	Data elements in group 12 03 000 000 (Supporting Documents) at the goods item level were missing or incorrectly displayed in Trader Portal.
Fix	The system was updated to properly display all required data elements for supporting documents at the goods item level, including the "Måleenhed" (Measurement Unit) field that was previously missing.
Impact	Users can now see and enter all required information for supporting documents at the goods item level.

3.43 English error messages displayed in Danish interface for Invalidation 4C requests

Ref: FT-34877, PSD-9896	
Description	When submitting an Invalidation 4C request in Trader Portal with Danish language selected, error messages were still displayed in English when validation errors occurred, such as when the "Type af toldbeløb" (48 08 000 000) field was not completed.
Fix	The system was updated to properly display validation error messages in Danish when the Danish language interface is selected for Invalidation 4C requests.
Impact	Users working in the Danish language interface now receive validation error messages in Danish rather than English

3.44 Inconsistent group structure for temporary storage declarations in Trader Portal

Ref: FT-34336	
Description	Temporary storage declarations (G4 and G4G3) had an inconsistent UI structure with a "Group General" that wasn't present in other declaration types, and the LRN was placed in this group rather than in Group 12 where it's normally found.
Fix	The system was updated to remove the "Group General" from G declarations in both Trader Portal and Customs Web Manager interfaces, and to move the LRN (data element 12 09 001 000) to Group 12 where it belongs according to the data model.
Impact	G-type declarations now have a consistent UI structure matching other declaration types, with the LRN properly placed in Group 12.

3.45 Missing mandatory field indicators in H1 declarations on Trader Portal

Ref: FT-33568	
Description	Mandatory data elements for H1 declarations were not properly marked with indicators in the Trader Portal interface, with only declaration type and additional declaration type being marked as mandatory despite many other fields also being required.
Fix	The system was updated to correctly mark all mandatory data elements for H1 declarations according to the requirements specified, including fields such as Invoice Currency (14 05

	001 000), Item Price (14 08 000 000), and Goods Reference (19 07 44).
Impact	Users can now clearly identify all mandatory data elements when creating H1 declarations in Trader Portal

3.46 Missing mandatory field indicators in H5 declarations on Trader Portal

Ref: FT-33543	
Description	Mandatory data elements for H5 declarations were not properly marked with indicators in the Trader Portal interface, with fields such as Transport Document, Valuation Method, Country of Origin, and TARIC Code missing the required indicators.
Fix	The system was updated to correctly mark all mandatory data elements for H5 declarations according to the requirements, including the previously unmarked fields like Goods Reference (19 07 44).
Impact	Users can now clearly identify all mandatory data elements when creating H5 declarations in Trader Portal

3.47 Missing mandatory field indicators in H4 declarations on Trader Portal

Ref: FT-33541	
Description	Mandatory data elements for H4 declarations were not properly marked with indicators in the Trader Portal interface, with fields such as Transport Document, Valuation Method, Preference, Country of Origin, and TARIC Code missing the required indicators.
Fix	The system was updated to correctly mark all mandatory data elements for H4 declarations according to the requirements specified, including the previously unmarked fields like Goods Reference (19 07 44).
Impact	Users can now clearly identify all mandatory data elements when creating H4 declarations in Trader Portal

4 Release 6.1.5.2-RC4

Environment	Release date
PROD	N/A
TFE02	09-04-2025

4.1 Missing Additions and Deductions field in H5 declarations at Goods Shipment level

Ref: FT36204	
Description	The Additions and Deductions field (14 04) was not visible at the Goods Shipment level in H5 declarations in the Trader Portal, despite being required according to EUCDM 6.2 specifications.
Fix	The underlying issue was fixed by adding the missing data element to the appropriate level in the user interface.
Impact	Users can now view and input Additions and Deductions information at the Goods Shipment level in H5 declarations.

4.2 Error DK9007 when creating Goods Registration through Manifest system

Ref: FT36169	
Description	Users encountered validation error DK9007 when Manifest system attempted to create Goods Registration Entries (GRE), despite receiving a successful 200 response code from DMS.
Fix	The issue was resolved by adding the missing manifest-system user in the Keycloak authentication system for the test environment.
Impact	Manifest system can now successfully create Goods Registration Entries and receive proper IEI87A responses, allowing for normal workflow processing between Manifest and DMS systems.

4.3 Incorrect warning message DKW1300 appearing on H3 declarations regarding delivery terms

Ref: FT or PSD	
Description	H3 declarations were incorrectly receiving warning DKW1300 about missing delivery terms information, despite the data element 14 01 000 000 being optional for this declaration type.

Fix	The business rule validation was updated to correctly handle the optional nature of delivery terms information in H3 declarations.
Impact	Users can now submit H3 declarations without delivery terms information and will no longer receive incorrect warnings or rejections.

4.4   Duplicate Goods Items sections appearing in H2 declarations on Trader Portal

Ref: FT-36117	
Description	When creating a new H2 declaration in the Trader Portal, users encountered two identical sets of Goods Items fields in the Goods Items tab instead of just one.
Fix	The underlying issue was fixed by removing the duplicate nested form from the H2_TP form configuration in Form Manager.
Impact	Users creating H2 declarations will now see only one set of Goods Items fields.

4.5   Validation errors with Delivery Terms fields in declarations

Ref: FT-36114	
Description	Users experienced inconsistent validation behavior when entering different combinations of Delivery Terms fields (TradeTerms), including situations where declarations were not properly rejected when required field combinations were missing.
Fix	The validation rules for Delivery Terms were corrected to properly enforce the required field combinations: either UN/LOCODE must be provided, or both Country Code and Location Name must be provided together.
Impact	Users now receive appropriate validation errors when submitting declarations with invalid Delivery Terms field combinations.

4.6   Error C3417 incorrectly appearing in CERTEX IES002 responses for importers

Ref: FT-35984	
Description	Users received error C3417 in IES002 responses when using CERTEX for CHED-PP certificates, despite correctly including importer information in the IES001 request.

Fix	The underlying issue in the CERTEX integration was fixed to properly recognize and process importer information provided in IES001 requests.
Impact	Users can now successfully submit declarations requiring CERTEX certificates (including CHED-PP and COI types) without receiving incorrect validation errors related to importer information.

4.7 Data disappears when reopening the same data element in Trader Portal

Ref: FT-35974, PSD-10460	
Description	When users opened a data element (such as DE 14 03) for a second time on the same declaration in Trader Portal, the previously entered data was no longer displayed.
Fix	The underlying issue causing data to disappear when reopening the same data element was fixed to properly maintain and display the data.
Impact	Users can now open and reopen data elements multiple times during declaration editing without losing visibility of their previously entered data.

4.8 Document upload failure during control process for import declarations

Ref: FT-35973, PSD-10455	
Description	When additional information was requested during control of an import declaration, users could not successfully upload required documents in Trader Portal despite the interface showing the request as "handled".
Fix	The underlying issue preventing document uploads during the control process was fixed for import declarations.
Impact	Users can now successfully upload requested documents during the control process for import declaration.

4.9 Unable to delete supplementary information in data elements

Ref: FT-35969, PSD-10450	
Description	Users were unable to delete values in certain data elements (specifically DE 14 03 040 005 and DE 15 09 001 000) when

	correcting rejected declarations in Trader Portal, as the values would persist even after deletion attempts.
Fix	The underlying issue preventing the deletion of values in specific data elements was fixed to properly process deletion requests.
Impact	Users can now successfully delete unwanted values in data elements when correcting rejected declarations.

4.10 Incorrect EORI number displayed when creating representative authorization

Ref: FT-35917, PSD-10443	
Description	When creating an authorization for a representative organization in Trader Portal, the system incorrectly displayed the principal's EORI number in the Representative Identification field instead of the selected representative's EORI number.
Fix	The system was updated to correctly display the representative organization's EORI number in the Representative Identification field when creating authorizations.
Impact	Users can now properly verify that the correct representative organization is being authorized during the authorization process.

4.11 Incorrect goods item number assigned to house consignment level in G4G3 declarations

Ref: FT-35913, PSD-10442	
Description	In G4G3 declarations, the system was incorrectly assigning a goods item number to the house consignment level, despite this being an overall level rather than an actual goods item.
Fix	The system was updated to correctly handle the hierarchical structure of G4G3 declarations, ensuring goods item numbers are only assigned to actual goods items and not to house consignment levels.
Impact	Users can now properly process G4G3 declarations with multiple master consignment items and successfully create A3 declarations for re-export of goods, as the goods item numbers are correctly assigned only to the appropriate levels.

4.12 Wrong codelist used for amendments in Trader Portal

Ref: FT-35908, PSD-10391	
Description	When making an amendment in TP-UI, the different amendment reasons would come from codelist 10187, when it should have come from 10057, at the same time to business rule should verify against the codelist 10057 rather than 10187.
Fix	The system was updated to use the correct codelist 10057 for amendment reasons in both Trader Portal and Customs Web Manager, and the business rule BR528_008 was updated to check against the correct codelist.
Impact	Users now see amendment reasons pulled from codelist 10057, as well as amendments being properly validated against the correct set of reason codes.

4.13 Unable to discharge fractional quantities of goods from previous declarations

Ref: FT-35898, PSD-10444	
Description	Users were unable to discharge fractional quantities of goods (e.g., 2.5 kg) from previous declarations, receiving schema validation errors stating "Value has too many fraction digits" despite the EUCDM specifying that the quantity format should support decimals.
Fix	The system validation was updated to allow fractional quantities in the discharge process, aligning with the EUCDM specification of format "n..16,6" for quantity fields.
Impact	Users can now discharge precise fractional quantities of goods from previous declarations.

4.14 Special Import Value Process not triggered by E02 additional code in declarations

Ref: FT-35894, PSD-10439	
Description	When submitting an H1 declaration with the E02 additional code (used for SIV - Special Import Value), the system did not trigger the expected special handling for SIV processing.
Fix	The system was updated to properly recognize the E02 additional code and trigger the appropriate SIV process flow when it's included in declarations.

Impact	Declarations containing the E02 additional code now correctly trigger the SIV process.

4.15 Direct representation automatically selected when creating authorizations in Trader Portal

Ref: FT-35892, PSD-10431	
Description	When creating a representative authorization in Trader Portal, the system automatically set the Type of Representation to "Direct" even when the user did not select this option, preventing users from creating indirect representation authorizations.
Fix	The system was updated to properly respect the user's selection for Type of Representation when creating authorizations, allowing both direct and indirect representation types.
Impact	Users can now correctly specify whether they want to create direct or indirect representation authorizations in Trader Portal.

4.16 System allows entry of negative values in Previous Document Quantity field

Ref: FT-35889, PSD-10437	
Description	When manually entering data in the Previous Document Quantity field at goods item level, users could enter negative values by using the down arrow or scroll functionality, which also should not be valid.
Fix	The system validation was updated to prevent entry of negative values in the Previous Document Quantity field, ensuring only valid positive numbers can be entered.
Impact	Users can no longer accidentally enter invalid negative quantities in Previous Document fields.

4.17 Missing lead text labels in declaration view

Ref: FT-35813, PSD-10461	
Description	Lead text labels were missing in various sections of declarations in the Trader Portal interfaces, such as under the Goods Items > Group 14 Valuation Information/Taxes section.
Fix	The missing lead text labels were restored to all relevant sections in the user interface.

Impact	Users can now better navigate and understand the declaration structure with properly labeled sections.

4.18 Validation error messages referencing MRN instead of LRN in Trader Portal

Ref: FT-35790, PSD-10436	
Description	When a declaration was rejected in Trader Portal, the validation error message referred to the declaration by its MRN, which is not visible to traders in the Trader Portal interface where only the LRN is displayed.
Fix	The validation error messages were updated to reference the declaration by its LRN instead of MRN when displayed in Trader Portal.
Impact	Traders can now more easily identify which declarations the validation error messages refer to, as the messages now use the LRN that is visible in the Trader Portal interface.

4.19 Incorrect amendment reason options when requesting corrections

Ref: FT-35782, PSD-10391	
Description	When requesting a correction for a declaration in Trader Portal, users were presented with a dropdown list of predefined reasons that were only applicable for invalidation requests, not corrections.
Fix	The system was updated to use the correct codelist (10057) for amendment reasons in Trader Portal.
Impact	Users can now select appropriate amendment reasons when requesting corrections due to declarations, ensuring the proper workflow and avoiding unnecessary rejections due to invalid reason codes.

4.20 Missing mandatory field indicators in H6 declarations on Trader Portal

Ref: FT-35678	
Description	Not all mandatory data elements for H6 declarations were visually marked as required in the Trader Portal interface, such as D.E. 14 13 (postal charges) and its underlying data elements.

Fix	The system was updated to correctly mark all mandatory data elements for H6.
Impact	Users can now clearly identify all mandatory data elements when creating H6 declarations in Trader Portal.

4.21 Incorrect national codes appearing in INV4c form dropdown menu

Ref: FT-35645, PSD-10313	
Description	When creating an INV4c form (repayment/remission request), the dropdown menu for data element VIII/8 - DE 48 08 000 302 incorrectly displayed test national codes (item codes 100 and 200) despite there being no national codes for repayment/remission in Denmark.
Fix	The system was updated to remove the incorrect test national codes from the dropdown menu in the INV4c form.
Impact	Users creating repayment/remission requests now see only valid options in the dropdown menu.

4.22 Incorrect goods item numbering after amendment in Trader Portal

Ref: FT-35613, PSD-10256	
Description	After submitting a correction to an H3 declaration with multiple goods items, all goods items were incorrectly renamed to item number "1" in the Trader Portal interface.
Fix	The system was updated to maintain correct sequential goods item numbering (1 through n) after amendments are processed.
Impact	Users can now view the correct goods item numbers after submitting corrections to declarations in Trader Portal, ensuring consistency between the declaration view and the actual data structure.

4.23 Missing CWMTAX notification for declarations

Ref: FT-35527, FT-35511, FT-31855, PSD-9357	
Description	When processing H declarations, the system was not creating and sending CWMTAX notifications to traders after goods were released, despite this being a required notification.

Fix	The system was updated to properly generate and send CWMTAX notifications for H declarations after goods release, consistent with other declaration types.
Impact	Traders now receive appropriate CWMTAX notifications after their H declarations are processed and goods are released.

4.24 Missing validation for preference documents in declarations

Ref: FT-35482	
Description	The system was not properly validating declarations with preference code 300, allowing them to be accepted without the required supporting preference documents.
Fix	The validation logic was updated to properly check for required preference documents when preference code 300 is used in declarations.
Impact	The system now correctly validates declarations with preference codes, ensuring that all required supporting documents are provided before a declaration can be accepted.

4.25 Incorrect mandatory setting for invoice amount data element

Ref: FT-35384, PSD-10120	
Description	Data element 14 06 001 (invoice amount) was incorrectly set as mandatory in the system, causing declarations to be rejected when this field was not filled in, despite it being optional according to requirements.
Fix	The system configuration was updated to make data element 14 06 001 optional as required, implementing a default value of "0" when the field is not provided by the user.
Impact	Users can now submit declarations without providing an invoice amount when not applicable, preventing unnecessary rejections.

4.26 Missing CWMTAX notifications for pre-lodged H1 and I1 declarations

Ref: FT-35267, PSD-10008	
Description	Traders were not receiving CWMTAX (customs tax) notifications for pre-lodged H1 declarations and certain I1 declarations, even when these declarations triggered customs debt and were in "Pending PGR" status.

Fix	The system was updated to properly generate and send CWMTAX notifications for pre-lodged H1 and I1 declarations when customs debt is calculated.
Impact	Traders now receive appropriate CWMTAX notifications for all declaration types that generate customs debt.

4.27 Missing goods accounting timer for retrospective H1 declarations

Ref: FT-35335, PSD-10052	
Description	When submitting an H1 retrospective declaration, the system was not starting the goods accounting timer as expected, despite this being required based on the retrospective date declared.
Fix	The system was updated to properly initiate goods accounting timers for retrospective H1 declarations, using the declared retrospective date as the starting point.
Impact	Goods accounting timers now correctly start for retrospective declarations.

4.28 Invoice currency not applied to item price in customs debt calculation

Ref: FT-35152, PSD-9936	
Description	The invoice currency specified in data element 14 05 was not being applied to the item price in data element 14 08 when calculating the customs debt base, resulting in incorrect customs duty calculations.
Fix	The system was updated to properly apply the invoice currency to item prices when calculating the customs debt base.
Impact	Customs debt calculations now correctly account for the invoice currency specified in declarations.

4.29 Incorrect field "ID-type" displayed in data element group 13

Ref: FT-35098, FT-34826, FT-34825, FT-34824, FT-34821, FT-34819, PSD-10193	
Description	An unnecessary identification type field was displayed under data element group 13 in the Trader Portal interface, despite this field not being defined in the EU Customs Data Model (EUCDM).

Fix	The system was updated to hide the "ID-Type" field from the user interface while ensuring it is automatically populated with the correct EORI type value in the background.
Impact	The user interface now correctly displays only the fields defined in the EUCDM for data element group 13

4.30 Deleted supervising office data persists in cloned declarations

Ref: FT-34485, PSD-9367	
Description	When cloning an H2 declaration and deleting data in DE 17 10 000 000 (Supervising Customs Office), the previously entered value (e.g., DK007902) still appeared in the XML file and PDF report despite being removed from the user interface.
Fix	The system was updated to properly clear deleted supervising customs office data when cloning declarations, ensuring that the XML and PDF outputs correctly reflect the current state of the declaration.
Impact	Users can now clone declarations and modify the supervising customs office field with confidence that the changes will be correctly reflected in all outputs.

4.31 Missing mandatory field indicators in H3 declarations on Trader Portal

Ref: FT-33538	
Description	Several mandatory data elements for H3 declarations were not visually marked as required in the Trader Portal interface, including transport document fields, valuation method, preference, country of origin, and TARIC code.
Fix	The system was updated to correctly mark all mandatory data elements for H3 declarations
Impact	Users can now clearly identify all mandatory data elements when creating H3 declarations in Trader Portal.

4.32 CERTEX specific fields not populated correctly in IES001 messages

Ref: FT-35971, PSD-10453	
Description	When submitting declarations requiring CERTEX certificates, specific fields in the IES001 messages were not being populated from the correct reference documents. This was the case for FGAS certificates as well as ODS certificates.

Fix	The CERTEX integration was updated to correctly map values from the appropriate additional reference documents to their corresponding fields in the IES001 messages.
Impact	CERTEX IES001 messages now correctly include specific data from the appropriate additional reference documents.

4.33 CERTEX amendments not triggering IES006 requests

Ref: FT-, PSD-	
Description	When creating an amendment to a declaration containing CERTEX certificate information, the system was not sending the required IES006 request to CERTEX to update the certificate reservation.
Fix	The system was updated to correctly send IES006 requests to CERTEX when amendments are made to declarations containing CERTEX certificates.
Impact	Amendments to declarations containing CERTEX certificates now correctly trigger updates to the certificate system.

4.34 Allocation message not being received with quota order

Ref: FT-35317	
Description	When submitting a H1 with a quota order, it triggers the quota integration but the declaration is able to move to a "Clearance Provided" status despite the quota relief not being allocated.
Fix	The integration with the quota system was updated to properly process and receive allocation messages, ensuring that quota requests are properly handled before declarations are cleared.
Impact	Declarations with quota requests now correctly wait for quota allocation before proceeding to clearance.

5 Release 6.1.5.2-RC3.1

Environment	Release date
PROD	N/A
TFE02	09-04-2025

5.1   Missing AEO authorization codes in G4 declaration dropdown menu

Ref: FT-36031	
Description	When creating G4 declarations in Trader Portal, users were unable to select AEO authorization codes (C501, C502, or C503) in Data Element 12 03, preventing proper declaration of AEO status.
Fix	The incorrect codelist reference was corrected to ensure the G4 declaration form displays the same authorization codes as H-declarations.
Impact	Users can now properly select AEO authorization codes (C501, C502, C503) when completing G4 declarations in the Trader Portal.

5.2   Missing Danish translations for Group 12 fields in the Trader Portal UI

Ref: FT-36005	
Description	When users selected Danish as their language in the Trader Portal, the fields in Data Element 12 04 000 000 at the goods item level remained in English instead of displaying in Danish.
Fix	The missing Danish translations for the affected fields in Group 12 were added to the system.
Impact	Users working in Danish can now see properly translated field labels in Data Element 12 04 000 000, improving the user experience for Danish-speaking traders.

5.3   Missing Danish translations for authorization fields in Trader Portal UI

Ref: FT-36002	
Description	When using the Danish language setting in the Trader Portal, the fields within Data Element 12 12 000 000 (Authorisation) at the goods item level were displayed in English instead of Danish.
Fix	The missing Danish translations for the authorization fields were added to the system.

Impact	Danish-speaking users can now see properly translated field labels in the authorization section at the goods item level, providing a more consistent and user-friendly experience.

5.4 Missing Danish translations for transport document fields in Trader Portal

Ref: FT-36001	
Description	When users selected Danish as their language in the Trader Portal, the fields in Data Element 12 05 000 000 (Transport document) at the goods item level remained in English.
Fix	The missing Danish translations for the transport document fields were added to the system.
Impact	Danish-speaking users can now see properly translated field labels in the transport document section at the goods item level, providing a more consistent localized experience.

5.5 Missing Danish translations for supporting document fields in Trader Portal

Ref: FT-35997	
Description	When using Danish as the selected language in the Trader Portal, the fields within Data Element 12 03 000 000 (Supporting document) at the goods item level were displayed in English instead of Danish.
Fix	The missing Danish translations for the supporting document fields were added to the system.
Impact	Danish-speaking users can now see properly translated field labels in the supporting document section at the goods item level, enhancing the localized user experience.

5.6 Incorrect title for goods information field in Trader Portal

Ref: FT-35896	
Description	In the Trader Portal, Data Element 18 09 was incorrectly labeled as "Kollioplysninger (18 06 000 000)" instead of the correct title "Vareoplysninger" (Goods Information).
Fix	The incorrect label was updated to display the proper title "Vareoplysninger" for Data Element 18 09.

Impact	Users can now see the correct field titles in the goods information section, eliminating confusion between package information and goods information fields.

5.7 H5 declarations without total gross mass incorrectly accepted by the system

Ref: FT-35895	
Description	The system was improperly allowing H5 declarations to be registered without the mandatory total gross mass field (18 04 000 001) at the declaration level, contradicting business requirements.
Fix	Validation was implemented to ensure that total gross mass at the declaration level is properly checked as a mandatory field for H5 declarations.
Impact	The system now correctly validates H5 declarations and rejects those missing the required total gross mass information, ensuring data completeness and compliance with business rules.

5.8 Incorrect data element reference in rejection message for I2GPR presentations

Ref: FT-35893	
Description	When attempting to present goods using an I2GPR message for an H3 declaration, the system was incorrectly rejecting the presentation with an error message referring to data element 16 15 000 000 instead of the correct data element 16 15 053 000 (Location of Goods - Additional identifier).
Fix	The validation error message was corrected to properly reference data element 16 15 053 000 and accurately describe the validation rule for the Additional identifier field.
Impact	Users now receive accurate error messages when their I2GPR presentations are rejected due to issues with the Location of Goods - Additional identifier field, enabling them to correct the proper field.

5.9 Missing Goods Accounting tab for Temporary Storage Declarations

Ref: FT-35863	

Description	The Goods Accounting functionality was not available for G5 (Temporary Storage) declarations in the Trader Portal, preventing users from accessing consumption information for these declarations.
Fix	The system configuration was updated to enable the Goods Accounting functionality for G5 declarations, making it accessible under the Consumptions tab.
Impact	Users can now access and manage Goods Accounting information for G5 declarations in the Trader Portal, allowing for proper tracking of goods consumption in temporary storage.

5.10 Unable to submit B1 export declarations in fallback mode through Trader Portal

Ref: FT-35784	
Description	Users attempting to submit B1 export declarations in fallback mode through the Trader Portal received an error message "Extension code is not valid (BR_VALI_0501_38)", preventing successful submission of these declarations.
Fix	The validation rule was updated to properly recognize and accept the "isFallback" extension code used when submitting declarations in fallback mode.
Impact	Traders can now successfully submit B1 export declarations in fallback mode through the Trader Portal, allowing for proper processing of exports during system outages or other fallback scenarios.

5.11 G5 declarations incorrectly rejected for date validation issues

Ref: FT-35763	
Description	G5 declarations were being rejected with error code BR_VALI_10015_200, but the error message did not clearly explain that the rejection was due to the date in field 12 02 009 000 being in the past or more than 90 days in the future.
Fix	The error message for BR_VALI_10015_200 was updated to clearly state that the date in field 12 02 009 000 must be in the future and no more than 90 days from the current date.
Impact	Users now receive a more informative error message when their G5 declaration is rejected due to date validation issues, helping them understand that the date must be in the future and within 90 days of submission.

5.12 Incorrect validation error for Turkish origin goods with F16 procedure

Ref: FT-35718	
Description	When submitting H1 declarations with additional procedure F16 and both "country of dispatch" and "country of origin" correctly set to "TR" (Turkey), the system was incorrectly rejecting the declaration with validation error DKW1200.
Fix	The validation rule was corrected to properly recognize Turkey (TR) as a valid country of origin and dispatch for declarations using the F16 additional procedure.
Impact	Traders can now successfully submit declarations with additional procedure F16 for goods originating from or dispatched from Turkey without receiving incorrect validation errors.

5.13 Unclear rejection message for H4 declarations missing delivery terms

Ref: FT-35717	
Description	When submitting an H4 declaration without the required delivery terms (14.01.000.000), the system was rejecting the declaration with an unclear error message about UN/LOCODE validation (BR_VALI_0501_100), which did not properly explain that delivery terms information was missing.
Fix	The error message was updated to provide clearer guidance, now stating: "For Delivery Terms, due to (D.E. 14 01 020 000) Country and (D.E. 14 01 037 000) Location not being provided, it is mandatory to provide UN/LOCODE (D.E. 14 01 036 000), and it must exist in codelist 50001."
Impact	Users now receive more descriptive and accurate error messages when submitting H4 declarations with missing delivery terms information, making it clearer what information needs to be provided and helping to reduce confusion and submission errors.

5.14 H4 declarations incorrectly accepting invalid previous document type 2GRE

Ref: FT-35679	
Description	The system was incorrectly accepting H4 declarations that included previous document type '2GRE' in data element 12.01.002.000, despite this document type being restricted for use only in G4G3 declarations referencing a GRE.
Fix	Business rules were updated across all applicable declaration types to properly validate that previous document type 2GRE

	is only used in appropriate contexts, ensuring that H4 declarations with this document type are correctly rejected.
Impact	The system now properly enforces document type restrictions, ensuring that the 2GRE previous document type is only used in appropriate declaration contexts, improving data quality and compliance with business requirements.

5.15 Missing quota allocation notifications preventing proper declaration processing

Ref: FT-35317	
Description	When submitting an H1 declaration with commodity code 0809 10 00 00 and quota order ID 090058, the system was incorrectly allowing the declaration to progress to "Clearance Provided" status without receiving the required quota allocation notification, bypassing the quota verification process.
Fix	The system was updated to properly handle quota allocation notifications, ensuring that declarations requiring quota allocation cannot proceed to clearance until the quota relief has been properly allocated to the customs debt.
Impact	The quota management process now functions correctly, with declarations requiring quota allocation properly held for quota verification before clearance, ensuring accurate tracking and allocation of quota resources and compliance with quota regulations.

5.16 Misleading error message for I2EIDR declarations missing required authorization

Ref: FT-35211	
Description	When submitting an I2EIDR declaration without the required C514 authorization code in data element 12.12, the system was displaying a misleading error message stating "License missing" instead of correctly indicating that an authorization was missing.
Fix	The error message was updated to provide clearer guidance about the missing requirement, now displaying "Documentation is missing" along with specific validation information: "For specified procedure categories, the required additional documents of type 'C514' is missing".
Impact	Users now receive more accurate and helpful error messages when submitting I2EIDR declarations without the required C514 authorization code, making it easier to understand and

	correct the issue without confusion between licenses and authorizations.

5.17 Missing data element numbers in Group 12 fields

Ref: FT-34964	
Description	Several data elements in Group 12 (Documents) were missing their proper data element (D.E.) numbers in Trader Portal, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to correctly display data element numbers for all Group 12 fields, ensuring proper identification of fields such as 12.01.001.000 (Previous Document Reference), 12.08.001.000 (Transport Document Reference), and 12.09.001.000 (Reference Number/UCR).
Impact	Users can now correctly identify all data elements in Group 12 by their standard EUCDM numbers.

5.18 Inconsistent labeling of applicant/decision holder fields in invalidation requests

Ref: FT-34895	
Description	In the invalidation request (4C) workflow, two fields with the same Danish label "Ansøger/modtager af afgørelsen (33.02.000.000)" appeared with different English translations - "(3/2 Application Holder ID" for the prefilled instance and "(3/2 Decision Holder ID" for the empty mandatory instance, creating confusion for users.
Fix	The field labels were updated to ensure consistency between Danish and English translations, clearly distinguishing between the application holder and decision holder fields according to the standards established by the translation task force.
Impact	Users now experience consistent and clear labeling when processing invalidation requests, with proper distinction between application holder and decision holder fields in both Danish and English interfaces, reducing confusion and improving the user experience.

5.19 Misleading Danish translation of CWMCAS notification in Trader Portal

Ref: FT-34848	
Description	The Danish translation of the CWMCAS (Customs Case) message in the Trader Portal was incorrectly translated as "afventer manuel håndtering" (awaiting manual handling), which did not accurately reflect the English meaning of "manual handling state".
Fix	The translation was updated to "Status på manuel håndtering" (status of manual handling) to more accurately reflect the meaning of the message and align with the terminology approved by Danish customs subject matter experts.
Impact	Users now see a more accurate Danish translation of the CWMCAS notification in the Trader Portal, providing clearer information about the status of declarations under manual processing and improving the overall user experience for Danish-speaking users.

5.20 Incorrect validation of delivery terms requiring both UN/LOCODE and country/location

Ref: FT-34318	
Description	The system was incorrectly rejecting H1 declarations with delivery terms (14.01.000.000) that included a valid UN/LOCODE but omitted country and location information, despite EUCDM 6.1 specifying that country and location should only be declared when UN/LOCODE is not available.
Fix	The validation rules for delivery terms were updated to properly implement EUCDM 6.1 requirements, allowing declarations with valid UN/LOCODE to be accepted without requiring the additional country and location information.
Impact	Users can now submit declarations with delivery terms that include only the INCOTERM code and UN/LOCODE without receiving incorrect validation errors, improving alignment with EUCDM 6.1 standards and reducing unnecessary rejections.

5.21 Missing manual work task for GRE amendments submitted by traders

Ref: FT-34113	
Description	When a trader submitted an amendment request for a Goods Registration Entry (GRE) through the Trader Portal, the system was incorrectly accepting the amendment automatically

	without creating the required manual acceptance work task for customs officers, with the CWMREQ notification containing "Granted automatically" annotation.
Fix	The system configuration was updated to properly trigger manual work tasks when amendments are requested for GRE declarations by traders, ensuring that these amendments receive appropriate review by customs officers.
Impact	Amendments to GRE declarations now correctly trigger manual work tasks for customs review, ensuring proper oversight of changes to goods registration information and preventing unauthorized or inappropriate modifications from being automatically accepted.

5.22 Incorrect rejection message for invalidation requests on released goods

Ref: FT-33788	
Description	When submitting an invalidation request with reason code 25 for an H1 declaration where goods had already been released, the system was incorrectly rejecting the request with a misleading message suggesting that the user should select reason codes 22-30, despite the user having already selected a valid reason code (25).
Fix	The system was updated to provide the correct rejection message for invalidation requests on released goods, now clearly explaining that a combined invalidation and repayment request (4C) is required when goods have been released and customs debt or VAT has been incurred.
Impact	Users now receive accurate guidance when attempting to invalidate declarations with released goods, with the system properly explaining that they need to submit a combined invalidation and repayment request (4C) or contact Danish Customs directly, rather than incorrectly suggesting they select a different reason code.

5.23 EU country codes incorrectly available in country of origin field for I1 declarations

Ref: FT-33764	
Description	When correcting rejected I1 declarations, users could select EU member states (such as AT - Austria) as the country of origin code in data element 16.08.001.000, despite these being invalid choices for this field. The system would then

	reject the correction with a generic "NOTVALID_COUN-TRY" error message that did not clearly explain the issue.
Fix	The country code list for data element 16.08.001.000 was updated to exclude EU member states from the available options, preventing users from selecting invalid country codes during the correction process.
Impact	Users now see only valid country options when selecting a country of origin code for I1 declarations, eliminating the possibility of selecting invalid EU member states and reducing confusion and unnecessary rejection errors during the correction process.

6 Release 6.1.5.2-RC3

Environment	Release date
PROD	N/A
TFE02	09-04-2025

6.1 I1 declarations incorrectly rejected for missing delivery terms UN/LO-CODE

Ref: FT-35978	
Description	The system was incorrectly rejecting I1 declarations with an error pointing to missing data element 14.01.036.000 (Delivery Terms - UN/LOCODE), despite this data element not being part of the required I1 dataset according to specifications.
Fix	The validation rules were updated to correctly reflect the I1 declaration data requirements, ensuring that I1 declarations are no longer rejected for missing data elements that are not part of the required dataset.
Impact	Users can now successfully submit I1 declarations without receiving incorrect validation errors related to delivery terms UN/LOCODE, improving the declaration submission experience and reducing unnecessary rejections.

6.2 Additional procedure code "950" incorrectly rejected despite being available in dropdown

Ref: FT-35934	
Description	When submitting declarations with additional procedure code "950" (selected from the available dropdown options), the system was incorrectly rejecting them with an error message stating that "950" does not exist in codelist 10027, despite the code being visible and selectable in the user interface.
Fix	The system configuration was updated to properly include the English translation for additional procedure code "950" in codelist 10027, ensuring that declarations using this code are correctly validated and accepted.
Impact	Users can now successfully submit declarations with additional procedure code "950" without receiving incorrect validation errors, improving the declaration submission experience and ensuring consistency between the available dropdown options and the validation rules.

6.3 Incorrect CERTEX validation error for non-C690 document types

Ref: FT-35819	
Description	When processing declarations with CHED-PP certificates (document type C085), the system was incorrectly triggering error C2025 related to the countryOfDispatch field in the IES005 message, despite this field only being required for document type C690, resulting in unnecessary validation failures.
Fix	The CERTEX integration was updated to properly handle the countryOfDispatch field based on document type, ensuring that this field is only required and validated for document type C690 and not incorrectly applied to other document types such as C085.
Impact	Declarations using CHED-PP certificates (C085) now process correctly without encountering erroneous validation errors related to the countryOfDispatch field, improving the reliability of the CERTEX integration for CHED-PP certificates and reducing unnecessary rejections.

6.4 Inconsistent document type code lists in the Trader Portal

Ref: FT-35811	
Description	There was some incorrect codes that were being displayed in the Trader Portal, particularly for Group 12 (Documents) fields.
Fix	The code lists in the Trader Portal were updated to ensure that the code list was accurate for different document types.
Impact	Users now experience consistent document type code options in the Trader Portal.

6.5 G4G3 declarations with multiple house items rejected due to sequence number errors

Ref: FT-35719	
Description	When submitting G4G3 declarations through the Trader Portal with a complex structure including declaration/master level, master item level, house consignment level, and multiple house item levels, the system was incorrectly rejecting them with sequence number validation errors that users had no control over.
Fix	The system's handling of sequence numbers in complex G4G3 declarations was updated to properly manage the

	numbering across multiple hierarchical levels, ensuring that declarations with multiple house items are correctly processed.
Impact	Users can now successfully submit complex G4G3 declarations with multiple house items through the Trader Portal without encountering sequence number validation errors, improving the declaration submission experience for more complex cargo structures.

6.6 NullPointerException in customs debt notification service causing declarations to get stuck

Ref: FT-35709	
Description	When processing declarations with multiple coverage types where one coverage had a means element and another didn't, a NullPointerException would occur that caused declarations to become stuck in the COV_Master_Flow without further processing.
Fix	The system was updated to include proper null checks before accessing the means element and its properties, ensuring that declarations with mixed coverage types are processed correctly without exceptions.
Impact	Declarations with multiple coverage types, particularly those with postponed payment methods, now process correctly without encountering NullPointerExceptions, improving system reliability and preventing declarations from becoming stuck in processing workflows.

6.7 Misleading error messages for XML element order issues

Ref: FT-35672	
Description	When submitting declarations with XML elements in an incorrect order, the system was returning misleading error messages such as "Declaration/GoodsShipment/DispatchCountry: Value is required" even when the element was present but in the wrong position, or "Unknown validation error" for certain element order issues, making it difficult for users to identify and fix the actual problem.
Fix	The error messages for XML element order issues were improved to clearly indicate when an element is in the wrong position rather than suggesting it is missing, and to provide more specific information about which elements are out of order, making it easier to identify and correct the issue.

Impact	Users now receive clearer and more accurate error messages when submitting declarations with XML elements in the incorrect order, helping them to quickly identify and fix structural issues in their submissions and reducing confusion caused by misleading error messages.

6.8 Misleading error message for invalid authorization number format in goods location

Ref: FT-35603	
Description	When users submitted declarations with location type 'B' (authorized place) and qualifier of identification 'Y' (authorization number), but with an authorization number that didn't follow the required format (DKTST- or DKIPO- followed by a journal number), they received a misleading error message suggesting that the qualifier of identification was missing or invalid, rather than indicating the actual issue with the authorization number format.
Fix	The error message was updated to correctly reference the authorization number field (16.15.052.000) instead of the qualifier of identification field (16.15.046.000), and to clearly explain that when qualifier 'Y' is used, the authorization number must follow the required format starting with DKTST or DKIPO.
Impact	Users now receive accurate and helpful error messages when their authorization numbers don't follow the required format, making it easier to identify and correct the issue without confusion about which field needs to be fixed.

6.9 G4 declarations stuck in release process after goods presentation

Ref: FT-35358	
Description	After presenting a G4 declaration with a G3 declaration and receiving no risk assessment issues, the declaration would become stuck in the workflow with a customs position state of "Release of goods" but would not progress to the final "Goods Released" state, preventing the completion of the declaration process.
Fix	The system workflow for G4 declarations was updated to properly handle the transition from the "Release of goods" customs position state to the final "Goods Released" state after risk assessment is completed with no issues.
Impact	G4 declarations now correctly complete the entire release process after goods presentation and risk assessment, allowing for the proper finalization of temporary storage

	declarations and enabling subsequent declaration types (such as H1 or D1) to reference the released G4 declarations.

6.10 Commodity code fields incorrectly auto-filling and disappearing in Trader Portal

Ref: FT-35270	
Description	When working with declarations containing multiple goods items in the Trader Portal, removing one goods item would cause commodity code fields (18.09.08.001, 18.09.09.056, 18.09.09.057, and 18.09.09.058) to disappear from the remaining goods items. Additionally, when entering a value in one of these fields, it would incorrectly auto-fill the same value into the other related commodity code fields.
Fix	The system was updated to properly maintain independent commodity code fields for each goods item, ensuring that removing one goods item does not affect the display or values of commodity code fields in the remaining goods items, and preventing incorrect auto-filling between related commodity code fields.
Impact	Users can now confidently work with multiple goods items in the Trader Portal without losing commodity code information when editing the declaration structure, and can enter different values for each commodity code field without unexpected auto-filling behavior.

6.11 Non-chronological goods item numbering after adding and deleting items

Ref: FT-35199	
Description	When adding and deleting goods items in declarations through Trader Portal, the system was not maintaining chronological numbering of the goods items, resulting in confusing sequences like items numbered 1, 3, 5 instead of 1, 2, 3.
Fix	The system was updated to properly renumber goods items in chronological order after any addition or deletion operations, ensuring that goods items are always displayed with sequential numbers regardless of the order in which they were added or modified.
Impact	Users now see consistently numbered goods items in Trader Portal, improving clarity and reducing potential confusion when working with declarations containing multiple goods items.

6.12 Missing validation information for DK and DMS error codes

Ref: FT-35183	
Description	When submitting declarations that triggered DK or DMS validation errors, the system was not displaying the detailed validation information in the Trader Portal messages and validation results sections, leaving users with only the error code but no clear explanation of the issue.
Fix	The UI was updated to properly display validation information for DK and DMS error codes, ensuring that users receive clear and detailed explanations of validation issues rather than just the error codes themselves.
Impact	Users now receive more helpful and detailed validation information when their declarations trigger DK or DMS validation errors, making it easier to understand and address the specific issues that need to be corrected in their submissions.

6.13 Unable to change document structure type during amendment

Ref: FT-35179	
Description	When amending rejected declarations, particularly H7 IMZ declarations requiring C514 authorization documents, users were unable to change the document structure type from "Additional reference document" to "Additional authorization document" in Group 12 fields, as the system would either ignore the change or generate validation error BR675_015 when attempting to submit the amendment.
Fix	The amendment process was updated to properly handle changes to document structure types, ensuring that users can successfully change from "Additional reference document" to "Additional authorization document" when needed, and the validation rule BR675_015 was adjusted to properly validate these changes.
Impact	Users can now successfully amend rejected declarations by changing document structure types as needed, particularly for H7 IMZ declarations that require C514 documents to be correctly classified as authorization documents rather than reference documents, improving the amendment process and reducing unnecessary rejections.

6.14 Misleading error message for XML element order issues in H4_IMZ declarations

Ref: FT-35116	
Description	When submitting H4_IMZ declarations with XML elements in an incorrect order (such as Previous Document positioned after TradeTerms), the system was returning a misleading error message about missing DispatchCountry, despite this element being present in the declaration, making it difficult for users to identify and fix the actual issue.
Fix	The error handling was improved to provide more accurate error messages that correctly identify when XML elements are in the wrong order, rather than incorrectly reporting missing elements that are actually present but misplaced in the XML structure.
Impact	Users now receive clearer and more accurate error messages when submitting H4_IMZ declarations with incorrectly ordered XML elements, helping them to quickly identify and fix structural issues in their submissions rather than being misled by incorrect error messages about missing elements.

6.15 Missing data element numbers in authorization fields at goods item level

Ref: FT-35078	
Description	Data element numbers were missing from authorization fields (12.12.000.000) at the goods item level in Trader Portal, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to display proper data element numbers for all authorization fields at the goods item level, ensuring that fields such as 12.12.001.000 (Authorization Type), 12.12.002.000 (Authorization Number), and other related fields are correctly labeled with their standard EUCDM numbers.
Impact	Users can now correctly identify all authorization fields by their standard EUCDM numbers in both interfaces.

6.16 Missing data element numbers in transport document fields at goods item level

Ref: FT-35077	
Description	Data element numbers were missing from transport document fields (12.05.000.000) at the goods item level in both the

	Trader Portal, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to display proper data element numbers for all transport document fields at the goods item level, ensuring that fields such as 12.05.001.000 (Document Reference Number), 12.05.002.000 (Document Type), and other related fields are correctly labeled with their standard EUCDM numbers.
Impact	Users can now correctly identify all transport document fields by their standard EUCDM numbers in both interfaces, improving clarity and consistency with official documentation and making it easier to reference specific fields when communicating about declarations.

6.17 Missing data element numbers in additional reference fields at goods item level

Ref: FT-35072	
Description	Data element numbers were missing from additional reference fields (12.04.000.000) at the goods item level in Trader Portal, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to display proper data element numbers for all additional reference fields at the goods item level, ensuring that fields such as 12.04.001.000 (Reference Number) and 12.04.002.000 (Type) are correctly labeled with their standard EUCDM numbers.
Impact	Users can now correctly identify all additional reference fields by their standard EUCDM numbers.

6.18 Missing data element numbers in supporting document fields at goods item level

Ref: FT-35070	
Description	Data element numbers were missing from supporting document fields (12.03.000.000) at the goods item level in Trader Portal, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to display proper data element numbers for all supporting document fields at the goods item level, ensuring that fields such as 12.03.001.000 (Document Reference Number), 12.03.002.000 (Document Type), and

	other related fields including measurement units are correctly labeled with their standard EUCDM numbers.
Impact	Users can now correctly identify all supporting document fields by their standard EUCDM numbers.

6.19 Incorrect data element numbers in previous document fields at goods item level

Ref: FT-35068	
Description	Data element numbers for previous document fields (12.01.000.000) at the goods item level were either missing or incorrectly formatted in Trader Portal, with some fields showing only partial numbers (e.g., "01 003" instead of "12 01 003 000").
Fix	The system was updated to display complete and correct data element numbers for all previous document fields at the goods item level, ensuring that fields such as 12.01.003.000 (Goods Item Number), 12.01.004.000 (Number of Packages), 12.01.005.000 (Measurement Unit and Qualifier), and 12.01.006.000 (Quantity) are properly labeled with their full standard EUCDM numbers.
Impact	Users can now correctly identify all previous document fields by their complete standard EUCDM numbers.

6.20 Manual release task not interrupted after declaration invalidation

Ref: FT-35059	
Description	When a declaration was invalidated through an additional message, the manual release work task was not being properly interrupted, allowing customs officers to continue processing the manual release even after the declaration had been invalidated, which resulted in the declaration status incorrectly changing from "Invalidated" to "In Accordance".
Fix	The system was updated to properly interrupt all open work tasks, including manual release tasks, when a declaration is invalidated, ensuring that invalidated declarations remain in their final "Invalidated" state.
Impact	The system now maintains proper workflow integrity by preventing further processing of invalidated declarations, ensuring that once a declaration is invalidated, it cannot be inadvertently moved to other states through completion of work tasks that should have been interrupted.

6.21 Missing Danish translations for save options in Trader Portal

Ref: FT-35026	
Description	When using the Danish language version of the Trader Portal, the save icon and its dropdown options ("Save as Template" and "Save as Draft") remained in English instead of being properly translated to Danish, creating an inconsistent user experience for Danish users.
Fix	The missing translations were added to ensure that when Danish is selected as the interface language, the save options are properly displayed in Danish as "Gem" (Save), "Skabelon" (Template), and "Kladde" (Draft).
Impact	Danish users now experience a fully localized interface when working with save options in the Trader Portal.

6.22 Inconsistent display of data element numbers in Group 12 fields

Ref: FT-34964	
Description	Data element numbers were missing or inconsistently displayed for fields in Group 12 (Documents) in Trader Portal, particularly for transport document reference (12.08.001.000) and reference number/UCR (12.09.001.000) fields, making it difficult for users to identify and reference specific fields according to EUCDM standards.
Fix	The system was updated to consistently display proper data element numbers for all Group 12 fields in the interface, ensuring that fields are correctly labeled with their standard EUCDM numbers.
Impact	Users now see consistent data element numbering across the interfaces, improving clarity and alignment with official documentation and making it easier to reference specific fields when communicating about declarations.

6.23 Missing validation rule for prelodged declarations with high statistical value

Ref: FT-34951	
Description	When submitting prelodged (IMD) H1 declarations where the valuation method was set to 1 and the statistical value exceeded 20,000 EUR / 150,000 DKK without providing additions and deductions data, the system was not applying the BR_VALI_0101_99 validation rule that would normally require this information, resulting in declarations being

	accepted at submission but later rejected after goods presentation.
Fix	The system was updated to properly apply the BR_VALI_0101_99 validation rule to prelodged declarations, generating a warning (DKW2054) when the conditions are met, ensuring consistent validation behavior between prelodged and standard declarations.
Impact	Users now receive appropriate warnings during the submission of prelodged declarations when additions and deductions information is required based on valuation method and statistical value, allowing them to address these issues before submission rather than discovering them only after goods presentation.

6.24 Incorrect country of preferential origin dropdown during amendment

Ref: FT-34847	
Description	When amending an H1 declaration that had been released, the dropdown list for Data Element 16.09.000.000 (Country of Preferential Origin) at the goods item level was displaying only country codes, omitting important region codes such as 2012 (EEA), 2200 (Central America), and 1033 (CARIFORUM) that should be available options.
Fix	The system was updated to display the complete and correct list of options for Country of Preferential Origin (16.09.000.000) during amendments, ensuring consistency with the options available during initial declaration submission.
Impact	Users can now select from the full range of valid country and region codes when amending the Country of Preferential Origin in released declarations.

6.25 Missing data element number and incorrect field name for previous document quantity

Ref: FT-34845	
Description	In Trader Portal, the "previousDocumentQuantity" field at the goods item level in Group 12 was missing its data element number (12.01.006.000) and displayed an incorrect field name that did not match the EUCDM standard. Additionally, when the interface language was set to Danish, the field name was not properly translated.

Fix	The field was updated to display the correct data element number (12.01.006.000) and renamed to "Quantity" in English and "Mængde" in Danish, in accordance with the EUCDM standards.
Impact	Users now see correctly labeled and numbered fields when working with previous document quantities at the goods item level.

6.26 Missing seal identification fields in G4 declarations.

Ref: FT-34653	
Description	When creating G4 declarations, several important data elements related to seals were missing from the user interface. In the Trader Portal (TP) interface, the Seal Identifier (19.10.015.000) field was missing.
Fix	The system was updated to properly display all required seal-related data elements, ensuring that the Seal Identifier (19.10.015.000) field appears in Trader Portal.
Impact	Users can now properly document seal information in G4 declarations, ensuring that important security and tracking information related to seals is captured correctly in temporary storage declarations.

6.27 Incorrect options in Country of Preferential Origin dropdown menu

Ref: FT-34603	
Description	The dropdown menu for Data Element 16.09.000.000 (Country of Preferential Origin) in Trader Portal contained incorrect country group codes and was missing required options. According to EU Commission requirements, this field should only allow selection of individual country codes or three specific country group codes (2012-EEA, 2200-Central America, and 1033-CARIFORUM).
Fix	The codelist (10236) controlling the dropdown menu was updated to include only the valid options: all individual country codes plus the three approved country group codes (2012-EEA, 2200-Central America, and 1033-CARIFORUM), while removing all other country group codes that were incorrectly included.
Impact	Users can now select from the correct and complete list of options when specifying a country of preferential origin, ensuring compliance with EU requirements and enabling proper

	application of preferential treatment based on valid origin documentation.

6.28 Missing error text for BR255_040 validation rule in rejection notifications

Ref: FT-34372	
Description	When a declaration was rejected due to business rule BR255_040 (which validates that the Declarant party identification is mandatory if the party identification type is set to EORI), the CWMREJ notification sent to traders did not include a specific error text describing the cause of the rejection, despite a requirement that all rejection notifications include specific error descriptions.
Fix	The system was updated to properly include descriptive error text for the BR255_040 validation rule in CWMREJ notifications, ensuring that traders receive clear information about why their declarations were rejected when this rule is violated.
Impact	Traders now receive more informative rejection notifications when their declarations fail validation against the BR255_040 rule, making it easier to understand and address the specific issues that need to be corrected in their submissions.

6.29 Missing Number of Seals field in G4 and G5 declarations

Ref: FT-34371	
Description	The Number of Seals field (19.10.068.000) was missing from Trader Portal when working with G4 and G5 declarations, preventing users from properly documenting the number of seals applied to transport equipment.
Fix	The system was updated to properly display the Number of Seals field (19.10.068.000) for G4 and G5 declarations, ensuring that users can document this important security information.
Impact	Users can now properly document the number of seals applied to transport equipment in G4 and G5 declarations.

6.30 Missing error text for BR10015_035 validation rule in rejection notifications

Ref: FT-34205	
Description	When a G4 or G4G3 declaration was rejected due to violation of business rule BR10015_035 (which validates previous document references), the CWMREJ notification sent to traders did not include a specific error text describing the cause of the rejection, despite a requirement that all rejection notifications include specific error descriptions.
Fix	The system was updated to properly include descriptive error text for the BR10015_035 validation rule in CWMREJ notifications, ensuring that traders receive clear information about why their declarations were rejected when this rule is violated, specifically regarding issues with previous document references.
Impact	Traders now receive more informative rejection notifications when their G4 or G4G3 declarations fail validation against the BR10015_035 rule.

7 Release 6.1.5.2-RC2

Environment	Release date
PROD	N/A
TFE02	09-04-2025

7.1 H3 XML uploads with errors now provide clear rejection reasons.

Ref: FT-35880	
Description	Users were receiving unclear error messages when attempting to upload H3 XML files containing errors, displaying only "{message}" instead of specific rejection reasons.
Fix	The system was updated to provide meaningful error messages that explain why H3 XML uploads are rejected.
Impact	Users can now understand the specific issues with their H3 XML files upon upload failure, allowing them to correct problems more efficiently.

7.2 H3 XML uploads with errors now provide detailed rejection reasons.

Ref: FT-35786	
Description	When uploading H3 XML files containing errors, users were only receiving a generic "{message}" error instead of specific information about what was wrong with their file.
Fix	The system was enhanced to provide a clear list of errors found in the H3 XML file during validation.
Impact	Users can now see exactly where errors exist in their H3 XML files, enabling them to quickly identify and fix issues before resubmitting.

7.3 Expected arrival time is now preserved when uploading G4 declarations via Trader Portal UI.

Ref: FT-35775	
Description	When users uploaded G4 declarations through the Trader Portal UI, the expected arrival time information was being removed, even though it was properly maintained when submitted via the API.
Fix	The system was updated to properly process and display the expected arrival time data from uploaded XML declarations in the Trader Portal UI.

Impact	Users can now upload G4 declarations through the UI and maintain all expected arrival time information, ensuring consistency between UI and API submission methods.

7.4 Partial release functionality now works correctly when some goods items are still under control.

Ref: FT-35698, PSD-10301	
Description	When a declaration had multiple goods items with different control statuses, the system was incorrectly releasing all goods and marking the declaration as "Clearance provided" instead of triggering a partial release.
Fix	The system was updated to properly recognize when some goods items are still under control and trigger the partial release workflow as intended.
Impact	Customs officers can now properly control individual goods items while allowing the release of already controlled items, ensuring compliance with control procedures while minimizing delays for cleared goods.

7.5 H6 and I1 declarations can now be submitted with representative fields properly filled in.

Ref: FT-35687, PSD-10270	
Description	Users were unable to successfully submit H6 and I1 declarations when representative fields were filled in, resulting in the submission process silently failing with no error message.
Fix	The system was updated to correctly process declarations with representative information, resolving the submission issue.
Impact	Users can now successfully submit H6 and I1 declarations with complete representative information through both the Trader Portal UI.

7.6 Missing commodity code fields have been added to Trader Portal UI for B1 declarations.

Ref: FT-35650, PSD-10248	
Description	The Harmonized System sub-heading code identifier (DE 18 09 056) and Combined Nomenclature code identifier (DE 18

	09 057) fields were missing from the Trader Portal UI in the Goods Items section.
Fix	The missing commodity code fields were added to the Trader Portal UI under Goods Items Group 18.
Impact	Users can now properly view and enter Harmonized System and Combined Nomenclature code information when creating B1 declarations in the Trader Portal UI.

7.7 Trader Portal UI now properly handles declarations with zero goods items.

Ref: FT-35643, PSD-10242	
Description	When users attempted to view declarations that had been submitted with zero goods items (which are invalid and rejected), the Trader Portal would display a blank white screen instead of showing the declaration details.
Fix	The system was updated to properly render declarations with zero goods items, allowing users to view the rejected declaration details.
Impact	Users can now view and understand why declarations with zero goods items were rejected, enabling them to correct the issue by adding the required goods items information.

7.8 Manual release decisions for H3 declarations are now properly recorded and viewable.

Ref: FT-35641, PSD-10237	
Description	After completing a manual release work task for an H3 declaration with a "not in accordance" decision, users were unable to view what decision had been made as the record disappeared from the system.
Fix	The system was updated to properly record and display manual release decisions after they are completed.
Impact	Customs officers can now review previous manual release decisions for H3 declarations, providing better transparency and audit trail for the release process.

7.9 Quota Order Number field has been removed from H4 declarations.

Ref: FT-35638, PSD-10253	

Description	The Quota Order Number field was incorrectly included in H4 declarations despite not being part of the H4 declaration type.
Fix	The system was updated to remove the Quota Order Number field from the Goods Item Group 14 in H4 declarations.
Impact	The Quota Order Number has now been removed from the H4 declarations.

7.10 Delivery Terms Location field length has been corrected.

Ref: FT-35630, PSD-10245	
Description	The Delivery Terms Location field (14 01 037 000) in the H1 XSD schema had an incorrect maximum length of 256 characters instead of the 35 characters.
Fix	The XSD schema was updated to enforce the correct maximum length of 35 characters for the Delivery Terms Location field.
Impact	The system now correctly validates Delivery Terms Location, preventing KRIA validation failures caused by exceeding character limits.

7.11 Fixed error logging when supplementary declaration timer is interrupted.

Ref: FT-35620	
Description	When a Customs Officer interrupted the timer for submitting a supplementary declaration for an I1 (IMB) declaration, an error message "PayableAccounting is WrongFormat accountingEntry" was incorrectly appearing in the logs.
Fix	The system was updated to properly handle the case when a supplementary declaration timer is interrupted, eliminating the incorrect error message in the logs.
Impact	The system now correctly processes interrupted supplementary declaration timers without generating misleading error messages, ensuring accurate record-keeping and proper fee management.

7.12 Fixed issue preventing declaration submission via Trader Portal UI.

Ref: FT-35617	

Description	Users were unable to submit declarations through the Trader Portal UI when clicking the submit button, particularly when the declaration contained representative information.
Fix	The system was updated to properly handle declarations with representative information, allowing successful submission through the Trader Portal UI.
Impact	Users can now successfully submit all types of declarations, including those with representative information, through the Trader Portal UI without experiencing submission failures.

7.13 Amendments to pre-lodged declarations after goods presentation are now possible.

Ref: FT-35609, PSD-10206, PSD-10011	
Description	After presenting goods via I2 for a pre-lodged I1 declaration, users were unable to amend the declaration, receiving errors about non-unique amendments or that the declaration could not be amended twice.
Fix	The system was updated to correctly recognize goods presentation as part of the declaration workflow rather than as an amendment, allowing subsequent amendments to be processed properly.
Impact	Users can now successfully amend declarations after goods have been presented, enabling corrections to declaration data when needed throughout the import process.

7.14 Fixed continuous loading issue in Trader Portal's Document Request section.

Ref: FT-35607, PSD-10219	
Description	When accessing the Document Request section in Trader Portal, the page would continuously load and attempt to retrieve documents, occasionally displaying error messages, even when no document requests were present.
Fix	The system was updated to properly handle the Document Request section loading, eliminating the continuous loading behavior and related error messages.
Impact	Users can now access the Document Request section in Trader Portal without experiencing continuous loading or error messages, improving the overall user experience and system stability.

7.15 Added missing G4 and G5 item codes in declaration dropdown menus.

Ref: FT-35606	
Description	When creating declarations manually, the G4 (Declaration for temporary storage) and G5 (Notification of arrival in case of movement of goods under temporary storage) item codes were missing from the dropdown menu in DE 11 04 001 000.
Fix	The missing G4 and G5 item codes were added to the dropdown menu in both Manifest - Midlertidig opbevaring og vareregistereing and Trader Portal UI, including their Danish translations.
Impact	Users can now select the appropriate G4 and G5 item codes when creating declarations manually.

7.16 Fixed issue with IEI85A responses not being sent to Manifest.

Ref: FT-35592, PSD-10198	
Description	After receiving an IEI84A message from Manifest, the system was not sending back the expected IEI85A response containing status information, preventing goods presentation from being properly processed.
Fix	The system was updated to correctly process incoming IEI84A messages and generate the appropriate IEI85A responses to Manifest.
Impact	The goods presentation process now works correctly when initiated from Manifest, allowing for proper status updates and additional message creation for presenting goods, ensuring seamless integration between Manifest and DMS.

7.17 Transport documents now displayed consistently in G4 declarations in the Trader Portal UI.

Ref: FT-35525, PSD-10175	
Description	For G4 declarations, the Transport Documents data element was not displayed consistently in the Trader Portal at the Master Items level and House/House Items level.
Fix	The system was updated to ensure consistent display of Transport Documents data elements in Group 12 in the Trader Portal UI.
Impact	Users now have a consistent view of Transport Documents information in G4 in Trader Portal UI.

7.18 Fixed UI issues when submitting RRA4C (Repayment/Remission Applications) in Trader Portal.

Ref: FT-35455, PSD-10127	
Description	When submitting an RRA4C through the Trader Portal UI, users experienced several issues including duty type values not saving correctly in Group 8 and validation errors in Group 7 Amount Duty despite all fields being filled.
Fix	The system was updated to properly handle form data in RRA4C submissions, ensuring that duty type values are correctly saved and all amount duty fields are properly validated.
Impact	Users can now successfully submit Repayment/Remission Applications (RRA4C) through the Trader Portal UI without experiencing data persistence issues or false validation errors.

7.19 Fixed mapping issue with estimated arrival time when cloning G4 declarations.

Ref: FT-35404 ,PSD-10112	
Description	When cloning a G4 declaration or submitting through the Trader Portal UI, the Estimated date and time of arrival at the port of unloading (DE 15 04 001) was not being properly mapped from the original declaration.
Fix	The system was updated to correctly map the expectedArrival element under the consignment section when cloning G4 declarations or submitting through the Trader Portal UI.
Impact	Users can now successfully clone G4 declarations with all data fields properly preserved, including the Estimated date and time of arrival at the port of unloading, improving efficiency by eliminating the need to manually re-enter this information.

7.20 UI issues with Repayment and Remission (RRA4C) submissions in Trader Portal

Ref: FT-35455	
Description	When submitting a Repayment and Remission Application (RRA4C) through the Trader Portal for an H1 declaration that had reached Clearance Provided status, users encountered several UI issues that prevented successful submission:

	In Group 8 (Duty Types), when adding multiple duty types (e.g., A00 and B00), the system would incorrectly retain values from the first entry.

In Group 7 (Amount Duty), the system would reject the submission with error BR673_010 indicating a null value in one of the Amount Duty fields, despite all fields appearing to be filled. |
| Fix | The form handling in the Trader Portal was updated to properly manage multiple duty type entries and to correctly validate and submit all Amount Duty field values, ensuring that RRA4C submissions can be completed successfully. |
| Impact | Users can now successfully submit Repayment and Remission Applications (RRA4C) through the Trader Portal without encountering data persistence issues or unexpected validation errors, improving the user experience and ensuring that legitimate repayment requests can be properly processed. |

7.21 H4 presentation failure in Trader Portal due to date format issues

Ref: FT-35396	
Description	When traders attempted to present an H4 declaration through the Trader Portal UI using the I2 Presentation action, the system would fail with an error related to "Declaration/IssueDateTime/DateTimeString" having an incorrect pattern. Additionally, after the failure, users were redirected to the search page rather than remaining on the declaration page, creating a disruptive user experience.
Fix	The system was updated to properly handle the date format for the IssueDateTime field during H4 presentations through the Trader Portal, ensuring that this system-managed field is correctly formatted without requiring trader input. The navigation behavior was also improved to keep users on the relevant page after submission attempts.
Impact	Traders can now successfully present H4 declarations through the Trader Portal UI without encountering errors related to date formatting or being unexpectedly redirected to the search page, improving the overall user experience and reducing presentation failures.

7.22 H3 declarations becoming stuck in validation state

Ref: FT-35392	

Description	When submitting certain H3 declarations through the Trader Portal API, the declarations would become stuck in the validation state indefinitely, preventing them from progressing through the normal declaration workflow and requiring manual intervention to resolve.
Fix	The system's validation process for H3 declarations was updated to properly handle complex declarations with multiple goods items and specific combinations of authorizations, ensuring that the validation process completes successfully and allows declarations to progress to the next state in the workflow.
Impact	Traders can now successfully submit complex H3 declarations without them becoming stuck in the validation state, improving the reliability of the declaration process and reducing the need for manual intervention by customs officers.

7.23 Missing certificate codes in supporting and additional reference document dropdown menus

Ref: FT-35390	
Description	The codelists controlling dropdown menus for document type fields in Data Elements 12.03.002.000 (Supporting Document Type) and 12.04.002.000 (Additional Reference Type) were missing several valid certificate codes that exist in the Danish Taric system, potentially preventing users from selecting required certificate codes for their declarations.
Fix	The codelists (CL10275 for Supporting Document Type and CL10272 for Additional Reference Type) were updated to include all valid certificate codes found in the Danish Taric system, with appropriate national metadata markers for Denmark-specific codes.
Impact	Users can now select from the complete range of valid certificate codes when specifying document types in their declarations, ensuring proper documentation of certificates required by Danish Customs and alignment with the Danish Taric system.

7.24 Unable to submit manually created I2EIDR declarations in Trader Portal

Ref: FT-35371	

Description	When users attempted to manually create and submit an I2EIDR (Entry in Declarant's Records presentation notification) through the Trader Portal UI, they encountered an error preventing submission, with the system displaying an error message about an unexpected error occurring during submission.
Fix	The validation and submission process for manually created I2EIDR declarations in the Trader Portal was updated to properly handle these declarations, ensuring that all required fields are correctly validated and the submission can be completed successfully.
Impact	Traders can now successfully create and submit I2EIDR declarations manually through the Trader Portal UI, providing an alternative to XML file uploads and improving the flexibility of the EIDR presentation process.

7.25 Incorrect autofill behavior in supporting documents section for I2EIDR declarations

Ref: FT-35370, PSD-10139	
Description	When creating multiple supporting document entries in group 12 (D.E. 12 03 000 000) for an I2EIDR declaration in Trader Portal, the Document Identifier field was incorrectly being autofilled with the value from the previous line for each new entry.
Fix	The system was updated to properly initialize form fields when creating new supporting document entries, ensuring that all fields start empty rather than inheriting values from previous entries.
Impact	Users can now create multiple supporting document entries in I2EIDR declarations without having to manually clear the Document Identifier field for each new entry.

7.26 Incorrect data element group appearing in G5 declarations

Ref: FT-35365, PSD-10089	
Description	Data element group 16 13 000 000 (Place of loading) was incorrectly available in G5 declarations in Trader Portal, despite not being part of the EU Customs Data Model for this declaration type according to EUCDM.

Fix	The system was updated to remove the incorrect data element group 16 13 000 000 from G5 declarations in Trader Portal.
Impact	G5 declarations now correctly align with the EU Customs Data Model requirements

7.27 Dual Use Export System certificate missing from CERTEX certificate codelist

Ref: FT-35360, ERMIS-57609	
Description	The DUES certificate type was not available in codelist 11068, preventing users from selecting it as a supporting document type when submitting declarations requiring CERTEX integration for dual-use goods.
Fix	The DUES certificate type was added to codelist 11068, making it available for selection in the supporting document section of declarations.
Impact	Users can now properly select DUES certificates when submitting declarations for dual-use goods.

7.28 Goods not appearing in goods accounting for released G4G3 declarations

Ref: FT-35342, PSD-10060	
Description	When a G4G3 (Temporary Storage Declaration) was released with no control and reached the "Release of goods" status, the goods were not being made available in goods accounting, preventing further processing of the goods from temporary storage.
Fix	The system was updated to properly place goods into goods accounting when G4G3 declarations reach "Release of goods" status.
Impact	Goods from released G4G3 declarations are now correctly available in goods accounting.

7.29 Error when submitting I2 Presentation message for H5 declarations in Trader Portal

Ref: FT-35333, PSD-10011	

Description	When attempting to present an H5 declaration via I2 Presentation message in Trader Portal, users encountered an error stating "Declaration/IssueDateTime/DateTimeString: Value does not match pattern '(\d{4})((\d{4})|((\d{10})(Z|[-+]\d\d)))?'.(code: OE0001)", preventing successful presentation of goods.
Fix	The system was updated to properly format the date-time string in I2 Presentation messages, ensuring compliance with the required pattern.
Impact	Users can now successfully submit I2 Presentation messages for H5 declarations through Trader Portal without encountering date format validation errors.

7.30 Missing Type of Person field in G5 declarations

Ref: FT-35331, PSD-10054	
Description	Data element 13 02 028 000 (Type of Person) was not visible in G5 declarations in Trader Portal despite being mandatory according to the EU Customs Data Model.
Fix	The system was updated to include the Type of Person field in G5 declarations at both Master Consignment and House Consignment levels in Trader Portal
Impact	Users can now properly complete G5 declarations with the required Type of Person information.

7.31 Transit validation failures due to null logger

Ref: FT-35327, PSD-10059	
Description	The transit validation process was unable to execute certain rules due to a NullPointerException with the message "logger is null", preventing successful validation of transit declarations.
Fix	The system was updated to properly initialize the logger object in the transit validation component.
Impact	Transit declarations can now be properly validated without encountering null pointer exceptions allowing for successful processing of declarations.

7.32 Missing estimated arrival time in G4 declarations on Trader Portal

Ref: FT-35316, PSD-10082	
Description	The Trader Portal interface was not displaying the value of Group 15 Dates-Times-Periods (expectedArrival) at Declaration/Master level for G4 declarations, despite this being a mandatory field in the XML file.
Fix	The system was updated to properly display the estimated arrival date and time information in G4 declarations on Trader Portal.
Impact	Users can now view the estimated arrival date and time information for G4 declarations in Trader Portal.

7.33 4C option missing for H5 declarations in Trader Portal

Ref: FT-35274, PSD-10020	
Description	When viewing an H5 declaration in "goods released" status in Trader Portal and clicking the "actions" button, the invalidation and repayment request option was not available in the dropdown menu, preventing traders from submitting such requests for H5 declarations.
Fix	The system was updated to include the 4C option in the actions dropdown menu for H5 declarations in the appropriate status.
Impact	Traders can now submit invalidation and repayment requests (4C) for H5 declarations through Trader Portal.

7.34 Unable to submit I2 presentation notifications through Trader Portal

Ref: FT-35272, PSD-10011	
Description	Users were unable to submit I2 presentation notifications (I2GPR) for prelodged declarations through Trader Portal due to a date format validation error, receiving the message "Declaration/IssueDateTime/DateTimeString: Value does not match pattern '(\d{4})((\d{4})|((\d{10})(Z|[-+]\d\d)))?'.(code: OE0001)". This issue also affected amendment submissions and EIDR declarations.
Fix	The system was updated to properly format the date-time string in I2 presentation notifications and other related messages, ensuring compliance with the required pattern.

Impact	Users can now successfully submit I2 presentation notifications, amendments, and EIDR declarations through Trader Portal without encountering date format validation errors

7.35 Missing CWMTAX notifications for pre-lodged H1 and I1 declarations

Ref: FT-35267, PSD-10008	
Description	Traders were not receiving CWMTAX notifications for pre-lodged H1 declarations and certain I1 declarations, even when these declarations triggered customs debt and were in "Pending PGR" status.
Fix	The system was updated to properly generate and send CWMTAX notifications for pre-lodged H1 and I1 declarations when customs debt is calculated.
Impact	Traders now receive appropriate CWMTAX notifications for all declaration types that generate customs debt.

7.36 Goods items not splitting after partial quota allocation

Ref: FT-35224, PSD-9982	
Description	When a partial quota allocation was granted through a work task, the system should have split the goods item into two separate items (one for the allocated portion and one for the non-allocated portion)
Fix	The system was updated to properly split goods items after partial quota allocation is granted, and the exceptions in the cwm-quota component were resolved.
Impact	Partial quota allocations now correctly result in the splitting of goods items.

7.37 Amendments not visible in Trader Portal after approval

Ref: FT-35217, PSD-9988	
Description	When traders submitted amendment requests through Trader Portal and these amendments were granted, the amended values were not being displayed in Trader Portal.
Fix	The system was updated to properly synchronize amendment data in the Trader Portal after amendments are granted.

Impact	Traders can now see their approved amendments in Trader Portal.

7.38 Misleading error message for missing EIDR authorization

Ref: FT-35211, PSD-9991	
Description	When submitting an I2EIDR declaration without the required C514 authorization code in data element 12 12, users received a misleading error message stating "License missing" or "Authorization does not exist".
Fix	The error message was updated to more accurately describe the issue.
Impact	Users now receive clearer and more accurate error messages when submitting I2EIDR declarations without the required authorization.

7.39 H1 declarations with 8f provision getting stuck when missing guarantee information

Ref: FT-35209, PSD-9732	
Description	When submitting an H1 declaration with 8f provision that would generate customs debt, but without the required ObligationGuarantee element, the system would get stuck in processing rather than properly rejecting the declaration with an appropriate error message.
Fix	The validation process was updated to properly check for the required ObligationGuarantee element in H1 declarations with 8f provision that generate customs debt.
Impact	The system now properly validates H1 declarations with 8f provision for the presence of guarantee information when customs debt is generated.

7.40 Unable to attach documents to 4C invalidation requests in Trader Portal

Ref: FT-35196, PSD-9971	
Description	When submitting a 4C invalidation request through Trader Portal, users were unable to attach supporting documents in data element 32 04 000 000
Fix	The system was updated to properly handle document attachments in 4C invalidation requests through Trader Portal.

Impact	Users can now successfully attach supporting documents to 4C invalidation requests in Trader Portal

7.41 System incorrectly accepting SupervisingOffice field in 8f applications via XML

Ref: FT-35188, PSD-10016	
Description	When submitting declarations with 8f applications through XML, the system was incorrectly accepting the SupervisingOffice field despite this field not being available in the Trader Portal interface for 8f applications.
Fix	The validation was updated to properly reject declarations with 8f applications that include the SupervisingOffice field when submitted via XML
Impact	The system now consistently enforces the same data requirements for 8f applications whether submitted through the user interface.

7.42 Unable to amend document structure type in Additional References

Ref: FT-35179, PSD-9941, PSD-10394	
Description	When attempting to amend a rejected declaration to change the structure type of a document from "Additional reference document" to "Additional authorization document" (particularly important for H7 IMZ declarations requiring C514 authorization), the change was not being applied and the structure type remained as "Additional reference document".
Fix	The system was updated to properly handle amendments to the document structure type field, allowing users to change from "Additional reference document" to "Additional authorization document" when needed.
Impact	Users can now successfully amend document structure types.

7.43 Unable to upload documents in Trader Portal when responding to document requests for transit declarations

Ref: FT-35169, PSD-9930	
Description	When customs officers requested additional documents (IEE46) for transit declarations, traders were unable to upload the requested documents through the Documents tab in Trader Portal.

Fix	The system was updated to properly display document requests in the Documents tab of Trader Portal for transit declarations
Impact	Traders can now view document requests and upload requested documents for transit declarations through Trader Portal.

7.44 System accepting invalid quota order IDs

Ref: FT-35126, PSD-9866	
Description	The system was accepting declarations with invalid quota order IDs (such as "abc`12") as long as they were 6 characters in length, without validating whether the ID was actually valid in the quota system.
Fix	The validation for quota order IDs was enhanced to check not only the length (6 characters) but also to verify that the ID exists and is valid in the quota system before accepting the declaration.
Impact	The system now properly rejects declarations with invalid quota order IDs.

7.45 XML error message structure not matching XSD schema

Ref: FT-35111, PSD-9652	
Description	Error messages returned by the system had an XML structure that did not match the defined XSD schema (trader-portal-error-response.xsd). The actual messages had nested <Parameter> tags instead of the expected flat structure with <Parameters> tags containing key-value pairs.
Fix	The error message generation was updated to ensure that the XML structure of error messages correctly follows the defined XSD schema.
Impact	Error messages now have a consistent and standards-compliant XML structure.

7.46 Previous document ID persisting when adding multiple supporting documents

Ref: FT-35099, PSD-9878	
Description	When adding multiple supporting documents in data element 12 03 at the goods item level, the Document Identifier field

	from the first entry was not being cleared when creating a second entry, causing the value to be incorrectly carried over.
Fix	The system was updated to properly initialize form fields when creating new supporting document entries.
Impact	Users can now add multiple supporting documents without having to manually clear the Document Identifier field for each new entry.

7.47 The Data Element numbers in Group 12 on goods item level are missing

Ref: FT-35078, FT-35077, FT-35072, FT-35070, FT-35068, FT-34845 PSD-10156, PSD-10225	
Description	Data elements in group 12 12, 12 05, 12 04, 12 03, and 12 01 at the goods item level were missing or incorrectly displayed in the Trader Portal.
Fix	The system was updated to properly display all required data elements at the goods item level.
Impact	Users can now see and enter all required information at the goods item level.

7.48 H4 declarations stuck in "Received" status

Ref: FT-35042, PSD-9732	
Description	H4 declarations were getting stuck in "Received" status instead of progressing to "Registered" status, preventing further processing of these declarations.
Fix	The system was updated to properly process H4 declarations, allowing them to move from "Received" to "Registered" status.
Impact	H4 declarations now correctly progress through the workflow.

7.49 Missing field label for D.E. 14 12 014 000 in H6 declarations

Ref: FT-34945, PSD-10156	
Description	The data element 14 12 014 000 (Amount) was missing its title/label in the Danish version of the Trader Portal interface for H6 declarations.

Fix	The system was updated to properly display the field label "Beløb (14 12 014 000)" for this data element in the Danish interface.
Impact	Danish-speaking users can now clearly identify the Amount field (14 12 014 000) when working with H6 declarations in Trader Portal.

7.50 UI jumping when using dropdown menus

Ref: FT-34933, PSD-9738	
Description	When using dropdown menus in the Trader Portal, the entire user interface would jump or shift position, creating a disruptive user experience.
Fix	The system's frontend components were updated to prevent the UI from jumping or shifting when dropdown menus are opened or used.
Impact	Users now experience a smoother and more stable interface when working with dropdown menus in the Trader Portal

7.51 Incomplete translation of G3 declaration submit page in Trader Portal

Ref: FT-34926	
Description	When creating a G3 declaration through Trader Portal, several elements on the Declaration Submit page were not translated to Danish, including labels such as "No records found" and various field names.
Fix	The system was updated with complete Danish translations for all elements on the G3 Declaration Submit page.
Impact	Danish-speaking users now experience a fully translated interface when submitting G3 declarations in Trader Portal.

7.52 H1 declarations getting stuck in validation status

Ref: FT-34912, PSD-9732	
Description	Certain H1 declarations were becoming stuck in "validation" status, neither being accepted nor rejected, due to an exception in the guarantee validation flow when processing declarations with null GRN values.
Fix	The system was updated to properly handle null GRN values during the guarantee validation process, preventing the null pointer exception that was causing declarations to become stuck.

Impact	H1 declarations are now properly processed through validation.

7.53 Declarations rejected with NOTVALID_SUPPLEMENTARYUNIT error for valid currency codes

Ref: FT-34908, PSD-9952	
Description	Declarations were being incorrectly rejected with error code DK11074 and message "NOTVALID_SUPPLEMEN-TARYUNIT: DKK" when using valid currency codes like DKK in the supplementary unit field.
Fix	The system was updated to properly validate currency codes in the supplementary unit field, ensuring that valid ISO currency codes like DKK are accepted.
Impact	Declarations using standard currency codes as supplementary units are now properly validated and accepted.

7.54 Goods account not decremented when transferring goods from H2 to H4 declarations

Ref: FT-34704, PSD-9621	
Description	When transferring goods from an H2 declaration to an H4 declaration, the goods account for the H2 declaration was not being decremented, resulting in inaccurate inventory tracking.
Fix	The system was updated to properly decrement the goods account for H2 declarations when goods are transferred to H4 declarations, ensuring accurate tracking of goods quantities.
Impact	The goods accounting system now correctly reflects transfers between different declaration types, specifically when moving goods from customs warehousing (H2) to inward processing (H4)

7.55 Incorrect amendment information displayed in work tasks for consignor name changes

Ref: FT-34398, PSD-9281	
Description	When a trader submitted a correction request to update the Consignor Name (D.E. 13 02 016 000), the system incorrectly created a work task indicating an amendment of "Party Identification" that was not requested by the trader, showing User

	ID as "Original Value" and Organization ID as "Amended Value" in both the work task and Additional Messages.
Fix	The system was updated to correctly display only the requested Consignor Name amendment in work tasks and Additional Messages, without adding the unrequested "Party Identification" amendment.
Impact	Work tasks and Additional Messages now accurately reflect the amendments requested by traders, specifically for Consignor Name changes.

7.56 Duplicate Method of Payment field appearing in amendment requests

Ref: FT-34392, PSD-9275	
Description	When creating an amendment request to add a Method of Payment (data element 14 03 038) on Goods Items, the field was appearing twice in the form.
Fix	The system was updated to display only one Method of Payment field (14 03 038) when creating amendment requests.
Impact	Users now see a cleaner interface with only one Method of Payment field when creating amendment requests.

7.57 Incorrect period of discharge for H4 declarations with C601 authorization

Ref: FT-34352, PSD-10154	
Description	When an H4 declaration was submitted with a C601 authorization, the expiration date in goods accounting was not being set according to the period of discharge retrieved from the authorization in DK-CRS.
Fix	The system was updated to use the correct period of discharge value when setting the expiration date in goods accounting for H4 declarations with C601 authorization.
Impact	The expiration date in goods accounting now correctly reflects the period of discharge specified in the authorization.

7.58 Missing error text for BR10043_001 in G3 presentation notifications

Ref: FT-34273, PSD-9247	

Description	When a G3 declaration is rejected due to BR10043_001, the CWMREJ (rejection) notification does not include a specific cause of the error.
Fix	The system was updated to include specific error text for the business rule in CWMREJ notifications.
Impact	Traders now receive more informative error messages when their G3 presentation notifications are rejected due to BR10043_001.

7.59 Missing error text for BR10015_034 in G4G3 declarations

Ref: FT-34206, PSD-9143	
Description	When a G4G3 declaration is rejected due to BR10015_034, the CWMREJ (rejection) notification does not include a specific cause of the error.
Fix	The system was updated to include specific error text for the business rule BR10015_034 in CWMREJ notifications.
Impact	Traders now receive more informative error messages when their G4G3 presentation notifications are rejected due to BR10015_034.

7.60 Stack trace exposed in API response for invalid XML submissions

Ref: FT-33877, PSD-9899	
Description	When submitting an H1 declaration with invalid XML format through the Trader Portal API, the system was returning a full stack trace in the response instead of a user-friendly error message, potentially exposing sensitive system information and making troubleshooting difficult for API users.
Fix	The error handling for invalid XML submissions was improved to return appropriate, structured error messages instead of stack traces, enhancing both security and usability.
Impact	API users now receive clear, concise error messages when submitting invalid XML.

8 Release 6.1.5.2-RC1.1

Environment	Release date
PROD	N/A
TFE02	09-04-2025

8.1 Users experienced declarations stuck in validation due to missing identification information.

Ref: FT-35628	
Description	When submitting H1 declarations where the declarant identification type was set to 1 (EORI) but the declarant identification number field was left empty, the declarations would become stuck in validation without being rejected or registered.
Fix	The validation system was updated to properly enforce business rule, ensuring that declarations with missing required identification information are promptly rejected with a clear error message rather than becoming stuck in validation
Impact	Users now receive immediate and clear feedback when submitting declarations with incomplete identification information, allowing them to quickly identify and correct the issue rather than having their declarations stuck indefinitely in the validation process.

8.2 Users encountered incorrectly named timer for G5 declarations.

Ref: FT-35468	
Description	When submitting G5 declarations, the system was creating a timer labeled "Timer for goods presentation," which was misleading since presentation of goods does not apply to G5 declarations.
Fix	The system was updated to correctly name the timer as "Time Window for Temporary Storage Time Window Expiration of Consignment," which accurately reflects its purpose for G5 declarations.
Impact	Users now see appropriately named timers when working with G5 declarations, reducing confusion and providing clearer information about the timing requirements specific to this declaration type.

8.3 Users experienced missing responses when registering goods in Manifest.

Ref: FT-35457	

Description	When Manifest sent an IEI86A message to create a goods registration entry (GRE) in DMS, the expected IEI87A response was not being returned, causing the original manifest reference number to remain in status 43 without progressing.
Fix	The system configuration was updated to ensure the manifest-system user was properly set up, resolving the XML validation error that was preventing the IEI87A responses from being sent back to Manifest.
Impact	Users can now successfully create goods registration entries through Manifest, with proper communication between systems ensuring that VREG/GRE records are created and acknowledged, allowing manifest reference numbers to progress beyond status 43.

8.4 Users could incorrectly apply for simplified VAT scheme with VAT registered companies.

Ref: FT-35237	
Description	The system was incorrectly accepting H1 declarations with Additional Procedure Code F49 (simplified VAT scheme) from importers with EORI numbers that were VAT registered, contrary to the requirement that only non-VAT registered companies should be able to use this scheme.
Fix	The validation system was updated to properly check the VAT registration status of companies applying for the simplified VAT scheme (F49), ensuring that declarations from VAT registered companies are rejected as required.
Impact	The system now correctly enforces the business rule that only non-VAT registered companies can apply for the simplified VAT scheme, preventing inappropriate use of this scheme and ensuring compliance with VAT regulations.

8.5 Users encountered incorrectly labeled data element in Group 36 for 8F applications, when submitting an H4.

Ref: FT-34703	
Description	When submitting an H4 declaration with procedure code 8F, users found that a data element in Group 36 was incorrectly labeled as "35 01 090 000" instead of having a proper Group 36 identifier, causing confusion about the data element's proper classification.
Fix	The Danish translations for the data element in Group 36 were corrected to properly reflect its placement in the data model, ensuring consistency between the element's location and its identifier.

Impact	Users now see correctly labeled data elements when working with 8F applications in H4 declarations, with Group 36 elements properly identified as belonging to Group 36.

8.6 Users experienced incorrect rejections when presenting G4 declarations through Manifest.

Ref: FT-34216	
Description	When attempting to present a G4 declaration through Manifest that had successfully passed validation and risk analysis with no issues, the system was incorrectly rejecting the presentation with status code '10' (MRN not found) in the IEI79A response.
Fix	The system was updated to properly implement the presentation of G4 declarations through Manifest, and the Manifest-System user was granted the necessary rights to submit G3 declarations, ensuring proper communication between the systems.
Impact	Users can now successfully present G4 declarations through Manifest, enabling proper processing of these declarations and supporting important customs workflows such as transfers between storage facilities, which depend on this functionality.

8.7 Users found missing timers for supplementary declarations after I2EIDR release.

Ref: FT-33281	
Description	When an I2EIDR (Entry in Declarant's Records) declaration was released, the system was not starting the required timer for submitting the supplementary declaration, preventing proper tracking of when these follow-up declarations were due.
Fix	The system was updated to properly check for and use the XIV/4 element in C514 authorizations, which specifies the deadline (in days) for submitting supplementary declarations. Additionally, a new business rule was implemented to reject declarations using C514 authorizations that are missing this critical element.
Impact	Users now see appropriate timers for supplementary declarations after I2EIDR release, ensuring proper tracking and notification of supplementary declaration deadlines. Additionally, the system now prevents the use of incomplete C514 authorizations that would lead to missing timers.

8.8 Users experienced unnecessary manual payment tasks for H1 end-use declarations.

Ref: FT-31766	
Description	When submitting H1 end-use declarations where the guarantee type was not provided, the declarant was registered for the 10 DKK scheme, and the duty amount was 0, the system was incorrectly creating manual cash payment work tasks despite these declarations qualifying for automatic processing.
Fix	The system was updated to properly recognize when H1 end-use declarations qualify for automatic processing under the 10 DKK scheme, ensuring that declarations meeting the specified conditions proceed directly to financial settlement without unnecessary manual payment tasks.
Impact	Users now experience streamlined processing for qualifying H1 end-use declarations, with the system correctly sending financial settlement to collection of the 10 DKK fee and releasing the goods without requiring manual intervention for payment processing.

9 Release 6.1.5.2-RC1

Environment	Release date
PROD	N/A
TFE02	09-04-2025

9.1 Users found missing goods item numbers when creating H3 declarations manually.

Ref: FT-35647, PSD-10251	
Description	When creating an H3 declaration through the Trader Portal UI and manually adding goods items, the system was not automatically populating the goods item number field (DE 11 03 001), leaving this mandatory information blank.
Fix	The system was updated to automatically populate the goods item number field when users manually add goods items to H3 declarations through the Trader Portal UI.
Impact	Users can now create H3 declarations with goods items through the Trader Portal UI without having to manually enter goods item numbers, as the system correctly assigns these numbers automatically.

9.2 Final Customs Debt not calculated for H1.

Ref: FT-35681	
Description	When submitting H1 declarations and completing all required work tasks including risk assessment verification, the system was not properly updating the Customs Debt State from "Provisional Customs Debt Determined" to "Final Customs Debt Determined" as expected.
Fix	The system was updated to correctly transition the Customs Debt State to "Final Customs Debt Determined" upon completion of all required processing steps for H1 declarations.
Impact	Users now see accurate customs debt state information for H1 declarations, with the system properly indicating when the final customs debt has been determined, ensuring clarity about the declaration's financial status throughout the customs process.

9.3 Users were not receiving goods registration notifications in Trader Portal.

Ref: FT-35492	

Description	When goods registration entries (GRE) were created in the system, the corresponding CWMGRE notifications were not being sent to the Trader Portal UI.
Fix	The system configuration was updated to ensure that CWMGRE notifications are properly sent to and displayed in the Trader Portal UI when goods registration entries are created.
Impact	Traders now receive timely CWMGRE notifications in the Trader Portal UI when goods registration entries are created.

9.4 Users could not view goods items for H3 declarations in Trader Portal.

Ref: FT-35478	
Description	When submitting H3 declarations, goods items data was not visible in the Trader Portal (TP) interface, with the Varepost (goods items) tab showing no data.
Fix	The system was updated to properly display goods items data for H3 declarations in the Trader Portal UI.
Impact	Traders can now view complete goods items information for their H3 declarations in the Trader Portal UI.

9.5 Users encountered incorrect task categories for guarantee-related manual release tasks.

Ref: FT-35406	
Description	When processing H4 declarations with Guarantee Type (99 02 001 000) where the declarant was not registered for the national guarantee scheme, the system was creating manual release tasks with the incorrect category "Guarantee trigger manual release" instead of the expected "Guarantee type I".
Fix	The system was updated to properly assign the correct task category "Guarantee type I" to manual release tasks generated when processing declarations with Guarantee Type I from declarants not registered for the national guarantee scheme.
Impact	Users now see consistent and accurate task categories for manual release tasks related to Guarantee Type I.

9.6 Users encountered incorrect validation errors when referencing previous declarations.

Ref: FT-35328	
Description	When submitting H1 declarations that referenced previous H2 declarations using the correct document type 'NMRN', users received incorrect validation errors stating that "if 'Warehouse

	Identifier' (12 11 015 000) is filled in, then 'Previous Document' (12 01 001 000) must be filled in and 'Type' (12 01 002 000) must be 'NMRN'", despite these conditions already being fulfilled.
Fix	The validation system was updated to correctly recognize when the required conditions are met for H1 declarations referencing previous H2 declarations, ensuring that declarations with properly filled warehouse identifier, previous document reference, and document type 'NMRN' are accepted.
Impact	Users can now successfully submit H1 declarations that reference previous H2 declarations without encountering incorrect validation errors.

9.7 Users were not receiving goods registration notifications in Trader Portal.

Ref: FT-35143	
Description	When goods registration entries (GRE) were created and processed in the system, the corresponding notifications (DMS-GRE and DMSGRR) weren't visible in the Trader Portal UI's Messages tab.
Fix	The system configuration was updated to ensure that goods registration notifications (DMSGRE and DMSGRR) are properly sent to and displayed in the Trader Portal UI.
Impact	Traders now receive timely notifications about goods registration entries and reminders in the Trader Portal UI.

9.8 Users encountered incorrect data element references in Group 99.

Ref: FT-34989	
Description	When creating declarations through the Trader Portal UI, the data element references in Group 99 at the declaration level were incorrectly displayed as "99 02 000 000" and "03 071" instead of the correct EUCDM references "99 02 001 000" and "99 03 071 000".
Fix	The system was updated to correctly display the proper EUCDM data element references for Group 99 fields at the declaration level in Trader Portal UI.
Impact	Users now see accurate and consistent data element references that properly align with the EUCDM when working with guarantee information in Group 99, improving clarity and ensuring proper reference to customs data elements.

9.9   Users were unable to submit C2EIDR declarations.

Ref: PSD-9028	
Description	When attempting to submit C2EIDR (Entry in Declarant's Records for exports) declarations, users found that their declarations would get stuck in validation without being rejected or accepted, making it impossible to successfully submit these declarations through either the Trader Portal UI or Postman.
Fix	The system was updated to properly process C2EIDR declarations, resolving issues with the KRIA adapter that were causing declarations to become stuck in the validation process.
Impact	Users can now successfully submit C2EIDR declarations through both the Trader Portal UI and API interfaces, with declarations being properly processed through the validation and risk assessment workflows without becoming stuck.

10   Release 6.1.5.1-final

Environment	Release date
PROD	N/A
TFE02	06-03-2025

10.1 H1 Declaration remains stuck in validation after submitting H4

Ref: FT-35261	
Description	When submitting and clearing a H4 declaration with 1 goods item in TP UI, and then submitting a H1 declaration, the H1 declaration then gets stuck in validation
Fix	The underlying issue was fixed.
Impact	H1 is now accepted in this scenario

10.2 Unable to submit Bill of Discharge through TP-UI for H4 declaration

Ref: FT-35187, PSD-9791	
Description	Users were unable to submit a Bill of Discharge message through TP-UI for an H4 declaration when attempting to discharge goods from a first H4 declaration with another H4 declaration.
Fix	The underlying issue was fixed.
Impact	Can now successfully submit BoD messages through the TP-UI for H4 declarations

10.3 Unable to find declaration with LRN set as 'LRN' in Trader Portal UI

Ref: FT-35150, PSD-9906	
Description	When submitting a declaration via TP UI with the LRN equal to 'LRN', the declaration will successfully submit but cannot be found in TP
Fix	The underlying issue was fixed.
Impact	It is now possible to find the declaration when submitting with 'LRN'

10.4 Application Period for Discharge is set to minutes

Ref: FT-35124, PSD-9859	
Description	When applying an 8f to a H3 Declaration, the period of discharge is incorrectly set to display in minutes.
Fix	The underlying issue was fixed.
Impact	The label for Application Period for Discharge now correctly displays the period without specifying minutes

10.5 Last date of Discharge is not visible in Trader Portal UI

Ref: FT-35123, PSD-9858	
Description	When applying a 8f to a H3 Declaration, and having the declaration reach 'Goods Released', the last date of discharge is not visible in TP UI
Fix	The underlying issue was fixed.
Impact	The last date of discharge is now displayed under the Expiration Date in Goods Accounting as expected

10.6 I2EIDR Group 15 Acceptance Date cannot be corrected

Ref: FT-35107, PSD-9855	
Description	The date and time selection box disappears after multiple attempts to change the acceptance date in group 15 of the TP UI.
Fix	The underlying issue was fixed.
Impact	Users can now change the acceptance date and time without the selection box disappearing.

10.7 When selecting Bill of Discharge from the Trader Portal actions, a new declaration is submitted

Ref: FT-35056, PSD-9791	
Description	When selecting to submit a BoD from the Trader Portal UI actions, the user is redirected to submit a new declaration instead of a BoD.
Fix	The underlying issue was fixed.

Impact	Users are now redirected to the BoD submission page rather than a new declaration submission page

10.8 DE 12 04 000 000 is incorrectly shown in the Trader Portal UI

Ref: FT-35048, PSD-9808	
Description	The DE 12 04 000 000 is incorrectly displayed in the UI under the Declaration/Master tab which should not be visible on G4 or G4G3 declarations
Fix	The underlying issue was fixed.
Impact	The DE 12 04 000 000 is now not shown on a G4 or G4G3 declaration

10.9 Trader Portal UI shows 2 data elements for G4 declaration in Group 18 Goods Identification

Ref: FT-35009, PSD-9783	
Description	The TP incorrectly displays two data elements in Declaration/Master Group18 Goods Identification for G4 declarations.
Fix	The underlying issue was fixed.
Impact	Only one data element "Total gross mass" is now shown in the Declaration/Master Group 18 Goods Identification for G4 D

10.10   Previous document type dropdown codelist is incorrect om House/House item level for G4G3

Ref: FT-34975, PSD-9810	
Description	In G4G3 declarations, the dropdown codelist for document type in DE 12 01 previous document at House/House Item level displays support document options instead of previous document options
Fix	The underlying issue was fixed.
Impact	The correct codelist for previous documents is now displayed in the dropdown at House/House Item level

10.11   DE 12 01 displays an incorrect heading in Trader Portal

Ref: FT-34963, PSD-9735	
Description	The heading of DE 12 01 does not match the EUCDM in English showing "Simplified declaration / Previous documents" instead of just "Previous documents"
Fix	The underlying issue was fixed.
Impact	Now displays the correct heading which is just "Previous documents"

10.12   Goods accounting data for H2 is not visible in Trader Portal

Ref: FT-34958, PSD-9728	
Description	The goods accounting data is not displayed in the TP UI for H2 declarations
Fix	The underlying issue was fixed.
Impact	Goods accounting now correctly reflects the available goods for H2 declarations in TP

10.13   Incorrect period label in DMS Online / Trader Portal

Ref: FT-34940	
Description	In an 8f application form, the field is incorrectly labeled as "Periode (minutter) in DMS online / TP
Fix	The underlying issue was fixed.
Impact	The field is now correctly labeled as "Periode" in the application tab

10.14   No validation check on UN LOCODE 14 01 036 000 on header level

Ref: FT-34939	
Description	When a declaration is submitted there is no validation check on UN/LOCODE in DE 14 01 036 000 on header level, meaning you could enter a non-valid UN / LOCODE and have the declaration pass.
Fix	The underlying issue was fixed.
Impact	The declaration is correctly rejected because of a wrong UN / LOCODE.

10.15   Translation of Guarantee Amount (DK) in field 99 03 071 is missing from Trader Portal

Ref: FT-34929	
Description	Even if the language selected is Danish, the Guarantee Amount (DK) in field 99 03 071 000 is displayed in the wrong language in TP
Fix	The underlying issue was fixed.
Impact	The Guarantee Amount is now shown correct depending on which language has been selected

10.16   Translation of Draft and Template is missing from Trader Portal

Ref: FT-34911, PSD-9742	
Description	Under the 'Search draft/template' tab, and 'Application type', both Draft and Template are written in English even when the Danish language is selected.
Fix	The underlying issue was fixed.
Impact	Draft and Template are now correctly displayed depending on the language which has been selected.

10.17   Data Element 16 03 000 000 refers to the wrong code list

Ref: FT-34900, PSD-9751	
Description	The DE 16 03 000 000 Bestemmelsesland under group 16 refers to the wrong code list and only EU countries should be allowed.
Fix	The underlying issue was fixed.
Impact	A drop down list only containing EU countries is now shown.

10.18   Missing validation information on generic error messages in Trader Portal UI

Ref: FT-34884, FT-34883, FT-34878, FT-34873, PSD-9029	
Description	When getting a validation result on BR_VALI_0401_53, BR_VALI_0202_21, BR_VALI_0101_34, and BR_VALI_0101_98, there is no error text displayed
Fix	The underlying issue was fixed.

Impact	The validation information is now displayed on the given error messages

10.19 Data Element 11 10 000 000 contains a dropdown codelist that is missing text explanations

Ref: FT-34862, PSD-9842	
Description	When a declaration is submitted though TP and the user navigates to group 11 and DE 11 10 000 000, there is a dropdown codelist which contains no explanation text after each code.
Fix	The underlying issue was fixed.
Impact	The dropdown codelist now has a text description of what the codes are.

10.20 G3 referencing an unknown MRN gets stuck in submitted

Ref: FT-34846, PSD-9662	
Description	When submitting a G3 declaration with an unknown MRN in 12 01 001 (Previous Document reference), the declaration gets stuck in submitted.
Fix	The underlying issue was fixed.
Impact	The declaration now correctly continues through the validation process, and gets rejected with an error message asking for an existing MRN.

10.21 Search fields lacked proper input validation

Ref: FT- 34843, PSD-9659	
Description	Several search fields in the Trader Portal (Commodity code, Importer reference number, MRN/ARC, and LRN) had no character limitations, allowing users to enter excessive text or potentially harmful scripts that could cause interface instability.
Fix	Input validation was implemented to limit the number of characters that can be entered in search fields and to prevent script injection.
Impact	Users now experience a more stable and secure search interface, with appropriate character limits preventing both accidental and intentional entry of excessive text that could cause performance issues.

10.22   Missing data element numbers for fiscal references

Ref: FT- 34835	
Description	In the Trader Portal interface, the data element "Supplerende fiscale referencer" (Additional fiscal references) in group 13 was displayed without its corresponding data element number (13 16 000 000).
Fix	The interface was updated to display the complete data element name including its number: "Supplerende fiscale reference 13 16 000 000".
Impact	Users now see consistent naming of data elements including their reference numbers across both the Trader Portal interface, making it easier to identify and reference specific data elements.

10.23   Business rule for G4G3 declarations was inconsistently applied

Ref: FT- 34827, PSD-9646	
Description	Business rule BR10015_060, which requires the declarant and consignor to be different entities in G4G3 declarations, was only being applied when the declaration included house consignment elements.
Fix	The system was updated to consistently apply the business rule for all G4G3 declarations, regardless of whether house consignment elements are present.
Impact	All G4G3 declarations now undergo consistent validation against business rule BR10015_060, ensuring proper enforcement of the requirement for different declarant and consignor entities.

10.24   Declarations with CERTEX documents became stuck in processing

Ref: FT- 34817, PSD-9673	
Description	Declarations containing CERTEX documents were becoming stuck in "Pending Validation" status without generating timeout tasks, preventing them from progressing through the customs clearance process.

Fix	The system was updated to properly handle document identifiers in CERTEX requests and create timeout tasks when necessary.
Impact	Declarations with CERTEX documents now either process correctly or generate appropriate timeout tasks that allow customs officers to manually intervene, ensuring that declarations do not become permanently stuck in the system.

10.25   Incorrect translation of container identification field

Ref: FT- 34815	
Description	The data element 19 06 061 000 (Container identification) was incorrectly translated in the Danish language version of the interface across all declaration systems.
Fix	The translation was corrected to properly display the field name in Danish.
Impact	Now the correct translation is used for the container identification field.

10.26   Missing goods reference field in declaration interfaces

Ref: FT- 34813, PSD-9753	
Description	The data element 19 07 044 000 (Goods reference) was missing from the user interfaces for H1-H5 and I1-I2 declarations, despite being a required field according to the EU Customs Data Model.
Fix	The system was updated to include the Goods reference field in the appropriate declaration forms within the Transport Equipment section.
Impact	Users can now properly enter and view goods reference information when working with transport equipment in declarations, ensuring compliance with EU data requirements.

10.27   Party management system incorrectly updated capabilities dates

Ref: FT- 34809	
Description	The party management system was updating the validity dates of office capabilities with each user login, causing office roles to appear invalid for use in declarations.
Fix	The system was modified to update only the "valid to" date when users log in, preserving the original "valid from" date to maintain proper validity periods for office capabilities.

Impact	Office capabilities now maintain their proper validity periods, ensuring that declarations using these offices are not incorrectly rejected due to apparent validity issues.

10.28   Import declarations incorrectly required SCO office role

Ref: FT- 34807, PSD-9628	
Description	The system was incorrectly requiring the Supervising Customs Office (SCO) role for customs offices on import declarations, even though this role is only applicable for export in centralized clearance scenarios.
Fix	The validation rules were updated to remove the SCO role requirement for customs offices on import declarations.
Impact	Users can now successfully submit import declarations with standard customs office designations without receiving incorrect rejections related to office roles.

10.29   Incorrect validation of Proof of Union Status requirements

Ref: FT-34746, PSD-9595	
Description	The system was incorrectly applying Proof of Union Status (PoUS) validation rules to H1 declarations and rejecting them when statistical values exceeded 15,000 EUR, even though these rules should only apply to H5 declarations.
Fix	The validation rules were updated to only apply PoUS requirements to H5 declarations, and to properly recognize declared PoUS numbers when validating H5 declarations with high statistical values.
Impact	Users can now successfully submit H1 declarations with statistical values over 15,000 EUR without rejection, and H5 declarations with proper PoUS documentation are correctly validated, eliminating unnecessary rejections.

10.30   Customs office of presentation incorrectly required for standard declarations

Ref: FT-34726, PSD-9624	

Description	The system was incorrectly requiring the Customs office of presentation (17 09 000 000) data element for all declarations, even though this field should only be required for centralised clearance scenarios according to EU Customs Data Model.
Fix	The validation rules were updated to only require Customs office of presentation when centralised clearance is being used.
Impact	Users can now submit standard declarations without having to provide unnecessary Customs office of presentation information, streamlining the declaration process for non-centralised clearance scenarios.

10.31   Previous document data elements displayed incorrectly

Ref: FT-34697, PSD-9593	
Description	When submitting declarations with previous document information, the CategoryCode and TypeCode data elements were incorrectly combined and displayed as a single value in the Trader Portal interface.
Fix	The system was updated to properly separate and display the CategoryCode and TypeCode data elements for previous documents.
Impact	Users now see correctly formatted previous document information in the interface, ensuring clarity and preventing confusion when reviewing declaration data.

10.32   Amendment submissions were being validated against incorrect code list

Ref: FT- 34688, PSD-9546	
Description	When submitting amendment requests in the Trader Portal, users were selecting reasons from code list 10057, but the system was validating these selections against code list 10187 (intended for invalidations), potentially causing incorrect rejections.
Fix	The system was updated to ensure that amendment reason validation uses the same code list (10057) that is presented to users in the interface.

Impact	Users can now submit amendment requests with confidence that the reason codes available in the dropdown menu will pass validation, eliminating confusing rejection messages.

10.33   H6 declarations displayed incorrect data element labels for postal charges

Ref: FT- 34585, PSD-9431	
Description	The H6 declaration form incorrectly referenced and displayed data elements from H7 declarations, showing "14 15" (Transport Costs) labels instead of the correct "14 13" (Postal Charges) labels.
Fix	The system was updated to correctly display the proper data element labels for H6 declarations, ensuring that group 14 13 elements are properly identified as Postal Charges rather than Transport Costs.
Impact	Users now see accurate and consistent labeling when working with H6 declarations, preventing confusion between postal charges (14 13) and transport costs (14 15) data elements.

10.34   System incorrectly allowed Bill of Discharge for H3 declarations

Ref: FT- 34426, PSD-9332	
Description	The system was allowing users to enable Bill of Discharge functionality for H3 declarations with procedure code 8f, sending CWMBOD notifications to traders even though Bill of Discharge is not applicable for this declaration type.
Fix	The system was updated to prevent Bill of Discharge from being enabled for H3 declarations, ensuring that the checkbox cannot be selected during customs position application processing.
Impact	Traders and customs officers now experience the correct workflow for H3 declarations with procedure code 8f, preventing confusion from receiving inapplicable Bill of Discharge notifications.

10.35   H3 declarations could not be presented through Manifest

Ref: FT- 34418, PSD-9314	
Description	Users were unable to create arrival declarations for H3 declarations in Manifest due to DMS returning an incorrect status

	code (0) in the IEI79A response instead of the expected status code (3).
Fix	The system was updated to return the correct status code in the IEI79A response for eligible H3 declarations.
Impact	Users can now successfully create arrival declarations for H3 declarations through Manifest, enabling proper presentation of goods and continuation of the customs clearance process.

10.36   G4G3 declarations were not sent for risk assessment

Ref: FT- 34415, PSD-9308	
Description	After acceptance of G4G3 declarations and completion of the Manual Calculation of Remaining Days work task, the system was not sending risk assessment requests to KRIA as required.
Fix	The system was updated to correctly trigger risk assessment requests for G4G3 declarations following acceptance and work task completion.
Impact	G4G3 declarations now properly undergo risk assessment in KRIA, ensuring that all required security and compliance checks are performed before goods can proceed through the customs process.

10.37   G4G3 declarations were proceeding despite blocking control results

Ref: FT- 34404, PSD-9288	
Description	When control results indicated major discrepancies that should block release, G4G3 declarations were incorrectly proceeding to "Goods Released" status instead of being invalidated.
Fix	The system was updated to properly interpret control results with major discrepancies and block the release of affected goods as required.
Impact	The system now correctly handles control results for G4G3 declarations, ensuring that goods with major discrepancies are properly blocked from release while allowing unaffected goods to proceed through the customs process.

10.38   Special Procedure timer was expiring prematurely

Ref: FT- 34393, PSD-9277	
Description	The "Time Window before sending a notification to the trader for the expiration of the special procedure authorization goods discharge period" timer was expiring immediately upon creation instead of on its scheduled expiration date.
Fix	The system timing mechanism was corrected to ensure that Special Procedure timers remain active until their proper expiration date.
Impact	Traders and customs officers now receive timely and accurate notifications regarding the expiration of special procedure authorizations, allowing proper planning for goods discharge within the authorized period.

10.39   Control state remained "In Progress" after control completion

Ref: FT- 34389, PSD-9224	
Description	When a declaration underwent risk-based control, the control state was set to "In Progress" but failed to update even after the control was completed and the declaration reached "Clearance provided (goods released)" status.
Fix	The system was updated to properly transition the control state from "In Progress" to the appropriate final state upon completion of control activities.
Impact	Users now see accurate control state information throughout the declaration lifecycle, providing clarity on whether controls have been completed or are still in progress.

10.40   Invalidation (4C) request shows extra fields that should be hidden

Ref: FT-34370, PSD-9318, FT-34369, FT-34368, FT-34367, FT-34365, FT-34364	
Description	When traders submitted invalidation and remission (RRM) requests through the Trader Portal, the interface was displaying data elements that should have been hidden.
Fix	The user interface for invalidation requests was updated to remove unnecessary data elements.
Impact	The following elements are no longer visible:

	• Bank Details (VIII/14) • Customs Office Location (VIII/3) • Customs Office Notified (VIII/2) • Recovery Titles (VIII/1) • Application Date (4/2) • Application Signature (1/2)

10.41   G4G3 declarations became stuck after amendment

Ref: FT-34358, PSD-9239	
Description	When users submitted amendments to G4G3 declarations that were in "Accepted" status but had not yet undergone control, the declarations would become stuck in the system without progressing.
Fix	The system was updated to properly handle amendments to G4G3 declarations in early processing stages.
Impact	Users can now successfully amend G4G3 declarations at any stage of processing without experiencing delays or declarations becoming stuck in the system.

10.42   Control state remained "In Progress" after completing partial release

Ref: FT-34338, PSD-9208	
Description	After completing partial release with controls and releasing all goods items, the control state incorrectly remained as "In Progress" instead of updating to "Finalized."
Fix	The system was updated to correctly transition the control state to "Finalized" when all control tasks are completed and all goods items are released in partial release scenarios.
Impact	Users now see accurate control state information for partial release cases, providing clarity on whether all control activities have been completed.

10.43   Added values for additions and deductions were being lost

Ref: FT-34325, PSD-9217	
Description	When users manually entered values in the "Additions and Deductions" field (14 04 000 000) while creating a declaration, these values would disappear upon submission.

Fix	The system was updated to properly retain values entered in the "Additions and Deductions" field during declaration submission.
Impact	Users can now confidently enter additions and deductions values when creating declarations, knowing that these values will be preserved throughout the submission process and appear correctly in the final declaration.

10.44   Missing field titles in G3 presentation notifications

Ref: FT-34271, PSD-9230	
Description	When creating G3 presentation notifications in the Trader Portal, some data fields in group 13 were displayed without titles or names, making it difficult for users to identify what information was required.
Fix	The system was updated to display proper titles for all data fields in G3 presentation notifications.
Impact	Users can now clearly identify all fields when creating G3 presentation notifications, improving the ease of data entry and reducing potential errors.

10.45   H1 declarations with processed products incorrectly accepted

Ref: FT-34254, PSD-9314	
Description	The system was incorrectly accepting H1 End-Use declarations with 8f applications that contained processed products information, which should only be allowed for inward or outward processing procedures.
Fix	The system validation was updated to properly reject H1 declarations that incorrectly include processed products information.
Impact	The system now correctly enforces data requirements for different declaration types, preventing users from submitting H1 declarations with processed products information that is only applicable to inward or outward processing procedures.

10.46   Amendment requests could be processed while declarations were locked

Ref: FT-34242, PSD-9781	

Description	The system was incorrectly allowing amendment requests to be processed for I1 declarations that were locked due to pending customs debt handling, creating premature "Customs Position on Message" work tasks.
Fix	The system was updated to prevent processing amendment requests for locked declarations until the Handle Customs Debt work task is completed.
Impact	The system now properly respects the declaration lock state, ensuring that amendments are only processed after all required customs debt handling is completed, maintaining the integrity of the declaration workflow.

10.47   Customs office field lacked autocomplete functionality

Ref: FT-34025, PSD-9086	
Description	The Customs office field (16 15 047 000) in the Trader Portal was implemented as a free-text field instead of providing autocomplete functionality, making it difficult for users to select valid office codes.
Fix	The system was updated to implement autocomplete functionality for the Customs office field, allowing users to select from a dropdown list of valid options.
Impact	Users can now more efficiently enter customs office information with reduced errors by selecting from a filtered list of valid options as they type, improving data entry speed and accuracy.

10.48   Control result discrepancies not automatically applied to declarations

Ref: FT-33940	
Description	When control results identified minor discrepancies of type "Add" or "Delete" with Manual Correction set to "No," the system was not automatically applying these changes to declarations as required.
Fix	The system was updated to properly apply all types of minor discrepancies (Add, Delete, and Update) to declarations when Manual Correction is set to "No."
Impact	Control results with minor discrepancies are now automatically applied to declarations when appropriate, eliminating

the need for manual intervention and ensuring that declarations accurately reflect the actual goods being processed.

10.49 Discharge periods from authorizations not correctly applied

Ref: FT-33904, PSD-9113	
Description	For declarations using special procedure authorizations, the system was not correctly retrieving and applying the period of discharge from DK-CRS, instead defaulting to a standard 10-day period.
Fix	The system was updated to correctly retrieve and apply the authorized period of discharge from DK-CRS when processing declarations with special procedure authorizations.
Impact	Users now see accurate discharge period timers that reflect the actual authorized periods in DK-CRS, ensuring proper tracking and management of goods under special procedures.

10.50 Declaration rejections lacked clear error messages

Ref: FT-33754, PSD-8803	
Description	When I1 declarations were rejected, the system was not providing specific error codes or reasons for the rejection, making it difficult for users to understand and fix the issues.
Fix	The system was updated to include clear error codes and descriptions in rejection messages, both in the Trader Portal interface and in CWMREJ notifications.
Impact	Users now receive detailed information about why their declarations are rejected, allowing them to quickly identify and correct issues without having to contact support for clarification.

10.51 Previous documents section contained incorrect data elements

Ref: FT- 33573, PSD-8796	
Description	The Previous Documents section (12 01) in the Trader Portal contained an invalid data element ("Value") and was missing several required data elements according to the EU Customs Data Model.
Fix	The system was updated to remove the invalid "Value" data element and add the missing required data elements to the Previous Documents section.

| Impact | Users now see the correct data elements in the Previous Documents section, ensuring compliance with EU standards and enabling proper entry of previous document references. |

10.52   CERTEX certificate Y123 validation fails for missing tonnesOfCO2 value

Ref: FT- 35349, PSD-10066	
Description	When submitting declarations with F-Gas certifications (Y123, C079), an error message "CertificateDataDTO.consignmentItem.tonnesOfCO2 null is not compliant" appears
Fix	The underlying issue was fixed.
Impact	Y123 primary certificate type now correctly works when paired with a secondary certificate type that populates the tonnesOfCO2 value in IES messages.

10.53   Rejected 8f requires decision period for discharge

Ref: FT- 35113, PSD-9847	
Description	When receiving a rejection on an 8f application for a H3 declaration, the system requires you to fill out the decision period for discharge
Fix	The underlying issue was fixed.
Impact	The declaration is now simply denied when receiving the rejection, causing both the combined declaration plus application to be rejected.

11 Release 6.1.5.1-RC3.3

Environment	Release date
PROD	N/A
TFE02	06-03-2025

11.1 Users experienced incorrect mandatory field indicators in G3 declarations

Ref: FT- 35175	
Description	Mandatory data elements for G3 declarations were not properly marked with indicators in the Trade Portal interface.
Fix	The system has been updated to correctly mark all required fields as mandatory in both interfaces.
Impact	Users can now clearly identify which fields must be completed when creating G3 declarations, reducing errors and improving the declaration submission process.

11.2 Goods Registration Entries were not visible for risk assessment

Ref: FT- 35148	
Description	When creating a Goods Registration Entry (GRE) for weight discrepancies between declarations and manifest, the entries were not appearing in KRIA for customs officials to perform risk assessment.
Fix	The system was updated to correctly send GREs to KRIA with the proper declaration type designation.
Impact	Customs officials can now view and perform risk assessment on all Goods Registration Entries, ensuring proper oversight of weight discrepancies between declarations and actual shipments.

11.3 H2 declarations incorrectly triggered Manual Cash Payment requirements

Ref: FT-35103	
Description	H2 declarations with procedure code 71 51 000 were incorrectly triggering Manual Cash Payment tasks despite qualifying for 100% duty suspension.
Fix	The system configuration was updated to correctly recognize procedure code 71 51 000 as eligible for full duty suspension.

Impact	Users submitting H2 declarations with procedure code 71 51 000 will no longer encounter unnecessary Manual Cash Payment requirements, streamlining the declaration process.

11.4 G5 declarations were being rejected due to incorrect location reference

Ref: FT-35060	
Description	Users were unable to submit G5 declarations as the system was incorrectly validating location information, causing declarations to fail with error BR_VALI_10015_13.
Fix	The system configuration was updated to correctly reference location data within the declaration structure.
Impact	Users can now successfully submit G5 declarations without receiving validation errors related to location information, enabling proper transfer between storage facilities.

11.5 Data element incorrectly displayed in declaration item view

Ref: FT- 35050, PSD-9789	
Description	Data element 12 08 000 000 was incorrectly appearing at the Master Item level in G4 declarations within Trader Portal interface.
Fix	The system was updated to remove the data element 12 08 000 000 from the Master Item and House Item views where it should not appear.
Impact	Users now see the correct data structure when working with G4 declarations, preventing confusion and ensuring proper data entry according to EUCDM standards.

11.6 Missing error message for rejected G3 presentation notifications

Ref: FT- 35023	
Description	When G3 presentation notifications were rejected due to business rule validation, the rejection notification (CWMREJ) did not include a specific error text explaining why the notification was dismissed.
Fix	The system was updated to include appropriate error text for validation failures in rejection messages.
Impact	Users now receive clear error messages explaining why their G3 presentation notifications are rejected, allowing them to correct issues more efficiently.

11.7 G5 declarations were being rejected despite having valid Customs Office codes

Ref: FT- 34993	
Description	Users attempting to submit G5 declarations with valid Customs Office IDs were experiencing rejections due to business rule BR_VALI_10015_14, which incorrectly flagged valid office codes as invalid.
Fix	The system configuration was updated to properly connect the business rule with the correct Customs Office code list (CL 10209).
Impact	Users can now successfully submit G5 declarations with valid Customs Office codes without experiencing incorrect validation rejections.

11.8 Data element 12 01 displayed incorrect heading in user interfaces

Ref: FT- 34963, PSD-9735	
Description	The heading for data element 12 01 in Trader Portal interface did not match the standard heading specified in EUCDM.
Fix	The heading text was updated to correctly match the EUCDM standard terminology.
Impact	Users now see consistent and correct terminology in the interfaces, improving clarity and ensuring alignment with EU customs standards.

11.9 Manual release tasks displayed incorrect category for INF documents

Ref: FT- 34750	
Description	When a declaration contained supporting document type C710 (INF), the system created a manual release task with an incorrect category label showing "Supporting Document Type has value C605 or C700" instead of "INF".
Fix	The English description in the reference data was updated to correctly display "INF" as the task category for C710 supporting documents.
Impact	Customs officers now see the correct task category when processing declarations with INF documents, improving clarity and ensuring proper handling of these special document types.

11.10 Users unable to use required document codes for G4 declarations

Ref: FT- 34618	
Description	When submitting G4 declarations with certain previous document types, users received rejection messages instructing them to use Z-codes that were not available in the system's dropdown menus.
Fix	The reference data was updated to include the appropriate document codes in the selection options, aligning with Denmark's document code requirements.
Impact	Users can now select the correct document codes when submitting G4 declarations, preventing unnecessary rejections and ensuring successful submission of declarations with proper document references.

11.11 Declarations incorrectly triggered Manual Cash Payment despite valid guarantee coverage

Ref: FT- 33911	
Description	H1/I1 declarations with valid SKAT Security Scheme coverage were incorrectly triggering Manual Cash Payment tasks, requiring unnecessary customs officer intervention.
Fix	The system was updated to correctly recognize declarations covered by the permille scheme (national guarantee for existing customs debt) and prevent unnecessary Manual Cash Payment tasks.
Impact	Declarations with valid guarantee coverage now proceed directly to goods release without requiring manual payment processing, streamlining the clearance process for qualifying traders.

11.12 Mandatory fields not properly indicated in H6 declarations

Ref: FT- 33552	
Description	In Trader Portal, only declaration type and additional declaration type were marked as mandatory for H6 declarations, while other required fields lacked proper indication.
Fix	The system was updated to correctly mark all mandatory fields with an asterisk indicator in the Trader Portal interface, particularly including Gross Mass (D.E. 18 04 001 000) at the appropriate level.
Impact	Traders can now clearly identify which fields must be completed when creating H6 declarations in the Trader Portal,

	reducing errors and improving the declaration submission process.

Environment	Release date
PROD	N/A
TFE02	06-03-2025

12.1 Data element in Group 15

Ref: FT-35085	
Description	The data element in Group 15 at goods item level was incorrectly displayed as "15 09 000 000" instead of the expected "15 09 001 000" in TP UI when creating H declarations.
Fix	The data element identification was corrected to properly display "15 09 001 000" as required by the declaration specifications.
Impact	Users can now see and work with the correct data element identification when processing H declarations, ensuring compliance with declaration requirements.

12.2 G3 authorization field in the declaration form

Ref: FT-34925, PSD-9768	
Description	The authorization data element (12 12 000 000) was incorrectly appearing, at the 'House/House Items' level for G3 declarations, despite not being part of the G3 data set requirements.
Fix	The form definitions for G3 declarations in TP UI were updated to remove the incorrect authorization field.
Impact	Users working with G3 declarations now see only the relevant and required fields in the interface, resulting in a more accurate and streamlined declaration process.

12.3 H1 declarations with End-user procedure

Ref: FT-34889	
Description	When submitting H1 End-Use declarations with procedure code 8F, users encountered validation errors regardless of whether the supporting document C990 was included or not, preventing successful declaration submission.

Fix	The business rule BR10071_002 that was incorrectly preventing the combination of End-Use authorization and supporting documents has been disabled.
Impact	Users can now successfully submit H1 declarations that include both End-Use procedure code 8F and the necessary supporting documents such as C990, streamlining the declaration process for End-Use goods.

12.4 Incorrect data element in H7 declaration form

Ref: FT-34881	
Description	When creating H7 declarations in TP UI, users would see data element 11 09 002 000 in Group 11, which is not part of the European Union Customs Data Model (EUCDM).
Fix	The system was updated to remove the non-compliant data element 11 09 002 000 from the H7 declaration interface.
Impact	Users now see only the correct and EUCDM-compliant data elements when creating H7 declarations, ensuring proper alignment with EU customs standards.

12.5 Incorrect data element in H7 declaration form

Ref: FT-34880	
Description	When creating H7 declarations in TP UI, users would see data element 11 09 001 000 in Group 11, which is not part of the European Union Customs Data Model (EUCDM).
Fix	The system was updated to remove the non-compliant data element 11 09 001 000 from the H7 declaration interface.
Impact	Users now see only the correct and EUCDM-compliant data elements when creating H7 declarations, ensuring proper alignment with EU customs standards.

12.6 Pre-lodged G4 declarations

Ref: FT-34711	
Description	When a pre-lodged G4 declaration was selected for document control during risk analysis, the system failed to send a CWMCTL notification to the trader about the upcoming control.
Fix	The risk analysis system was updated to correctly handle G4 declarations by returning the proper control type and

	notification parameters, similar to how pre-lodged import declarations are processed.
Impact	Traders now receive proper control notifications when their pre-lodged G4 declarations are selected for document control, improving transparency and allowing them to prepare appropriately for the control process.

12.7 Incorrect include preference data in H5 declarations.

Ref: FT-34416	
Description	The system was incorrectly allowing data element 14 11 000 000 (Duty/Tax/Fee preference) to be included at the goods item level in H5 declarations, despite this element not being permitted according to the customs data model.
Fix	The system was updated to remove the preference field from the goods item level in the H5 declaration interface.
Impact	Users now have a more accurate H5 declaration interface that properly reflects data element requirements, preventing potential confusion and errors during the declaration process.

12.8 Unclear validation errors when submitting O1 declarations

Ref: FT-33783	
Description	When submitting O1 declarations where the declarant was not a private person, users encountered validation errors related to the declarant EORI field, but the system did not clearly indicate that the identification type field was the actual cause of the error.
Fix	The validation system was updated to correctly highlight the identification type field (located below D.E. 13 05 017 000) when it requires input, providing clearer guidance to users.
Impact	Users now receive accurate visual indicators showing exactly which fields need attention when submitting O1 declarations, leading to a more intuitive and efficient declaration process.

12.9 Incorrect data elements in H6 declaration forms.

Ref: FT-33706	
Description	The location of goods data element (16 15 000 000) was incorrectly visible in the TP UI when creating H6 declarations, despite

	this element not being part of the European Union Customs Data Model (EUCDM) for H6 declarations.
Fix	The system was updated to hide the location of goods data group (Group 16) from the H6 declaration interface in TP UI.
Impact	Users now see only the correct and EUCDM-compliant data elements when creating H6 declarations through the UI.

13 Release 6.1.5.1-RC3.1

Environment	Release date
PROD	N/A
TFE02	06-03-2025

13.1 Missing translations for D.E's in Trader Portal UI

Ref: FT-34904	
Description	D.E's 14 07 001 000, 14 08 001 000, 14 10 001 000 and 14 11 001 000 are displayed with English text despite the language being set to Danish
Fix	The underlying issue was fixed.
Impact	The D.E's are now displayed in the language that has been selected

13.2 MSI IM/U is rejected for I1 declarations referenced CO/C

Ref: FT-34385, PSD-9324	
Description	It should be possible to submit an MSI IM/U for a referenced CO/C but in this case it is rejected due to incompatible types.
Fix	The underlying issue was fixed.
Impact	The MSI IM/U is now accepted rather than rejected

13.3 Missing mandatory indicators for several fields in I1 Declaration Trader Portal UI

Ref: FT-33571	
Description	There are several mandatory fields within the I1 declaration which should be marked with indicator to show that they are mandatory, however, this is currently not the case for some of the fields
Fix	The underlying issue was fixed.
Impact	All the mandatory fields / data elements are now marked as mandatory

13.4 Missing mandatory indicators for several fields in H2 Declaration Trader Portal UI

Ref: FT-33534	
Description	There are several mandatory fields within the H2 declaration which should be marked with indicator to show that they are mandatory, however, this is currently not the case for some of the fields
Fix	The underlying issue was fixed.
Impact	All the mandatory fields / data elements are now marked as mandatory

14 Release 6.1.5.1-RC3

Environment	Release date
PROD	N/A
TFE02	06-03-2025

14.1 G5 discharging from a G4G3 with too much weight is not rejected.

Ref: FT-34947	
Description	When trying to send in a G5 that discharges from a G4G3 with more weight than is available on the G4G3 the G5 is not rejected, which it should be.
Fix	The underlying issue was fixed.
Impact	The G5 declaration with too much weight is rejected.

14.2 Delivery terms is missing after submitting a H4 declaration

Ref: FT-34893	
Description	When an uploaded H4 declaration is submitted the delivery terms in 14 01 and the underlying DEs are missing
Fix	The underlying issue was fixed.
Impact	The declaration is submitted successfully, and not rejected due to data in DE 14 01 being deleted.

14.3 Errors in application when submitting an H3 with 8F

Ref: FT-34771, PSD-9644	
Description	When a H3 with 8F application is submitted, and the application has been granted by a customs officer, 2 errors are thrown.
Fix	The underlying issue was fixed.
Impact	The application should be granted after the customs officer has filled out their part of the application. Errors should appear before the EO when submitting.

14.4 DEs are combined on the same line

Ref: FT-34764, PSD-9651	
Description	When making a correction for a G4 DE 12 03 000 000, 12 04 000 000, 12 05 000 000 and 12 12 000 000 are combined on the same line in Group 12.
Fix	The underlying issue was fixed.
Impact	That DE 12 03 000 000, 12 04 000 000, 12 05 000 000 and 12 12 000 000 are located at separate Groups/line.

14.5 Dropdown menu for DE 16 09 000 000 contains wrong information.

Ref: FT-34724	
Description	Dropdown menu for DE 16 09 000 000 contains wrong information and are missing information
Fix	The underlying issue was fixed.
Impact	The dropdown menu contains the right information.

14.6 H6 with invalid Supporting Document

Ref: FT-34722, PSD-9585	
Description	When selecting invalid values for GoodsItem, SupportingDocument and TypeCode a H6 will not upload in TP UI, without a helpful error message.
Fix	The underlying issue was fixed.
Impact	A proper error message is shown.

14.7 Rejection is not received if LRN contains Æ, Ø, Å

Ref: FT-34719	
Description	Rejection message is not recieved by TP if Submitter reference (LRN) contains Æ, Ø or Å.
Fix	The underlying issue was fixed.
Impact	Trader recieves rejection notification

14.8 Discrepancy between messages on TP and DMS Internal (Import and Export)

Ref: FT-34717	
Description	Discrepancy between messages on TP and DMS Internal (Import and Export)
Fix	The underlying issue was fixed.
Impact	There is no discrepancy

14.9 When completing a manual worktask a message is not sent.

Ref: FT-34709	
Description	It's possible to write comments to submitters when completing manual acceptance work tasks, but comments are not sent. Remarks from work tasks are not visible for the Trader if the work task is completed with acceptance.
Fix	The underlying issue was fixed.
Impact	It should not be possible to write a comment to submitter when manual acceptance work task is completed with "Accept", as the comment is not sent to the submitter.

14.10   Mismatch in headline in DMS Online and TP

Ref: FT-34698, PSD-9616	
Description	Headline on a declaration in DMS Online - TP is named in Danish 'Angivelse' it should be 'Hoveddel'.
Fix	The underlying issue was fixed.
Impact	Danish users now experience consistent terminology in TP.

14.11   Domain names in dropdown

Ref: FT-34664, PSD-9616	
Description	Manifest:
	The DMS "tab" is misleadingly named Manifest in the top blue line to the right. In Danish it should read Midlertidig opbevaring og vareregistrering
	Export:

	We have noticed that in the top blue line on the right it says EKSPORTER. In Danish it should read EKSPORT
Fix	The underlying issue was fixed.
Impact	That what is written in the blue line and tab matches the texts below. • Midlertidig opbevaring og vareregistrering • Eksport

14.12   No CWMTAX notification is sent to TraderPortal for an I1.

Ref: FT-34646, PSD-9522	
Description	When sending an I1 and KRIA result is returned Green - it is expected that the following messages are received in Trader-Portal • 'CWMTAX' notification is received
Fix	The underlying issue was fixed.
Impact	Following messages are received in TraderPortal • 'CWMTAX' notification is received

14.13   Addition and deductions on Declaration level is removed when submitting

Ref: FT-34638	
Description	Addition and deductions add on Declaration level is removed when submitting the declaration
Fix	The underlying issue was fixed.
Impact	Addition present and added to customs value.

14.14   When an MSI is manually created via TP it stops as it is stuck in validation

Ref: FT-34632, PSD-9509	
Description	When a I1/MSI is manually created via TP it stops as it is stuck in validation.
Fix	The underlying issue was fixed.

Impact	I1 declaration no longer gets stuck when creating an MSI referencing the I1 manually in TP UI

14.15 G3 – Manifest, stuck in pending validation

Ref: FT-34627, PSD-9393	
Description	Users submitting G3 declarations via the manifest functionality experienced issues where declarations would become stuck in the "pending validation".
Fix	The underlying issue was fixed.
Impact	Users can now successfully submit G3 manifest declarations without them becoming stuck in validation.

14.16 Representative field incorrectly set as mandatory for G3 declarations.

Ref: FT-34621	
Description	Users were unable to submit G3 declarations without filling in the Representative field (D.E. 13 06), despite this field being defined as conditional rather than mandatory.
Fix	The underlying issue was fixed.
Impact	Representative (D.E. 13 06) should not be mandatory for the G3.

14.17 AcceptanceDateTime disappearing from PreviousDocuments when submitting empty corrections

Ref: FT-34600, PSD-9497	
Description	The correction made via TP to a H1 declaration which does not contain any changes removes AcceptanceDateTime from PreviousDocuments.
Fix	The underlying issue was fixed.
Impact	Users can now submit corrections via Trade Portal without unintentionally losing AcceptanceDateTime data in PreviousDocuments.

14.18 Unauthorized access to Bill of Discharge timer functions.

Ref: FT-34599, PSD-9442	
Description	According to established criteria the CO needs to have a role/right to handle the Bill of Discharge timer, however, currently it is possible to handle, claim, and update the timer without having that role.
Fix	The underlying issue was fixed.
Impact	The Update Timer work task for the Bill of discharge timer is not accessible for the CO without the CustomsPositionOnBOD rights.

14.19 Invalidation of H1 used for disposal of goods for an H2

Ref: FT-34592, PSD-9436	
Description	When an H1 declaration used for disposal of goods for an H2 declaration was invalidated, the goods accounting in the H2 declaration was not properly updated to reflect the cancellation of the disposed amount.
Fix	The underlying issue was fixed.
Impact	The amount disposed of by the H1 declaration in goods accounting in the H2 is deleted/canceled.

14.20 H6 form wrongly refers to subelements of 14 15 from H7

Ref: FT-34585, PSD-9431	
Description	The H6 and H7 forms use the same elements in group 14 13 (H6) and group 14 15 (H7), even though they should be separate elements (Value and Currency exists as seperate data elements).
Fix	The underlying issue was fixed.
Impact	Users now see correctly labeled form fields when working with H6 declarations, with proper differentiation between H6 and H7 forms, reducing confusion and potential data entry errors.

14.21 INV4C B2B Requires request headers for Code and Reason elements

Ref: FT-34565, PSD-9503	
Description	The B2B API for INV4C requests was requiring the inclusion of "changeReasonText" and "changeReasonCode" headers, unlike standard invalidation requests where these headers could be omitted if values were provided in the XML body.
Fix	The underlying issue was fixed.
Impact	B2B integrations can now use consistent request patterns across all invalidation types.

14.22 Confusing error message when submitting a second invalidation request

Ref: FT – 34562, PSD - 9499	
Description	When attempting to submit a second invalidation request for a declaration that already had a pending invalidation, the system would return error code OE0040 with an incorrectly referenced both amendment and invalidation processes: "Already an amendment for this LRN found, it cannot be amended twice" and "Already a pending Invalidation for this LRN found, it cannot be invalidated twice".
Fix	The error message for OE0040 was updated to provide clear and specific information related only to the actual operation being performed, removing references to unrelated processes when responding to duplicate invalidation requests.
Impact	Users now receive clear and accurate error messages when attempting to submit a second invalidation request.

14.23 Inconsistent identification of additional messages in CWMREJ notifications

Ref: FT – 34560, PSD - 9496	
Description	When an invalid additional message (such as an Invalidation or Correction) was rejected, the system generated a CWMREJ notification that incorrectly labeled the additional message identifier as "MRN" instead of "URN", creating inconsistency with other notification types (CWMRCV and CWMREQ) that correctly used the "URN" tag.

Fix	The system was updated to consistently use the "URN" tag when referencing additional message identifiers in all notification types, including CWMREJ notifications.
Impact	All notification types (CWMREJ, CWMRCV, and CWMREQ) now consistently identify additional messages with the correct "URN" tag.

14.24   Bill of Discharge missing from H4 declarations with 8f application

Ref: FT – 34559, PSD - 9414	
Description	When processing an H4 declaration with an 8f application, the Bill of Discharge information entered during the "Customs Position on Application" work task was not being saved to the declaration, causing the information to disappear from Trader Portal interfaces after completing the task.
Fix	The system was updated to properly save and display Bill of Discharge information, during the application approval process.
Impact	Bill of Discharge information is now correctly saved and displayed in Trader Portal interfaces after completing the Customs Position on Application work task.

14.25   H1 declarations with valid REX numbers incorrectly rejected during validation

Ref: FT – 34542	
Description	When submitting H1 declarations with Registered Exporter (REX) numbers in the supporting document section, the system was incorrectly rejecting them with error DK2032, stating "the REX number does not exist or is not valid" despite the numbers being valid in the DK-CRS database.
Fix	The integration between systems was updated to properly validate REX numbers, ensuring that valid REX identifiers are correctly recognized and accepted.
Impact	Users can now successfully submit H1 declarations with valid REX numbers.

14.26   Incorrect code list displayed for previous document types in G3G4 declarations

Ref: FT – 34533, PSD - 9405	

Description	When working with G3G4 declarations in the Trader Portal and attempting to add a previous document at the master consignment item level, the system was incorrectly displaying the supporting documents code list (CL 10275) instead of the previous document type code list (CL 10273).
Fix	The system configuration was updated to correctly link the appropriate code list (CL 10273) to data element 12 01 002 000 (Previous Document Type) at the master consignment item level.
Impact	Users can now select from the correct list of previous document types when completing G3G4 declarations at the master consignment item level.

14.27 Unable to remove identification type in Group 13 fields within Trader Portal

Ref: FT – 34532, PSD - 9514	
Description	When users attempted to remove data from field Identification type in an H7 declaration through the Trader Portal, the system would retain the original value.
Fix	The system was updated to properly process and save field deletions in Group 13 data elements, particularly for the Identification type field.
Impact	Users can now successfully modify or remove identification type information in Group 13 fields within the Trader Portal.

14.28 I1 declarations failing with repeated LRN validation errors during arrival notification

Ref: FT - 34531	
Description	When creating an arrival notification (IEA62) for an I1 declaration, the system was generating multiple identical error messages regarding data element 12 09 001 000 (LRN), and incorrectly setting status code 9 in the IEI85A Import Declaration Update Response.
Fix	The validation process for arrival notifications was corrected to properly handle LRN references and to generate appropriate status codes in the IEI85A Import Declaration Update Response.
Impact	Users can now successfully submit arrival notifications for I1 declarations without encountering repeated validation errors, and the system correctly updates the declaration status in the manifest, ensuring smooth processing of import declarations.

14.29   Inconsistent validation of Goods Location information in G-type declarations

Ref: FT – 34525, PSD - 9402	
Description	The system had issues with validating Goods Location infor- mation in G declarations, including accepting invalid location type codes, rejecting declarations with valid coordinates, and allowing submissions with multiple conflicting location iden- tifiers.
Fix	Comprehensive validation rules were implemented for Goods Location information in G-type declarations, ensuring proper validation of location type codes, coordinates format, and pre- venting the use of multiple conflicting location identifiers in the same declaration.
Impact	The system now properly validates Goods Location infor- mation according to business rules, ensuring that only valid location information is accepted and providing appropriate re- jection messages when invalid data is submitted, improving data quality.

14.30   H1 declarations with conflict statuses when presenting goods.

Ref: FT – 34516, PSD – 9398	
Description	When submitting a pre-lodged H1 declaration and presenting the goods via a G3 before preliminary risk assessment results were received, the H1 declaration could end up in a conflicted state of being simultaneously "pending manual acceptance" and "under manual release" once the risk assessment response was received.
Fix	The system was updated to properly handle the sequence of events when goods are presented, ensuring that declarations progress through their workflow states in the correct order without conflicting statuses.
Impact	The experience a more consistent and predictable declaration workflow when presenting goods, with declarations properly maintaining a single, clear status at all times.

14.31 Declaration in status conflict when presenting rejected goods.

Ref: FT – 34561, PSD - 9425	
Description	When submitting a pre-lodged H1 declaration and presenting the goods via a G3 before preliminary risk assessment results were received, the H1 declaration could end up in a conflicted state of being simultaneously "rejected" and "under manual release" once the risk assessment response was received.
Fix	The system was updated to properly handle the sequence of events when goods are presented before risk assessment is completed, ensuring that declarations maintain a single, consistent status even when rejection occurs during the process.
Impact	Users now experience a more predictable declaration workflow when presenting goods before risk assessment is complete, with rejected declarations properly maintaining their rejected status without progressing to conflicting states like "under manual release."

14.32 G3 declarations stuck in "Submitted" status in Trader Portal

Ref: FT – 34515, PSD - 9393	
Description	When submitting G3 declarations through the B2B interface, they would remain stuck in "Submitted" status in the Trader Portal.
Fix	The system was updated to properly handle party identification validation during G3 declaration processing, resolving a null pointer exception that was causing declarations to become stuck in the validation workflow.
Impact	G3 declarations submitted through the B2B interface now progress properly through the validation process and appear in both the Trader Portal.

14.33 Procedure codes disappearing in I2 Presentation Notifications causing validation failures

Ref: FT – 34511, PSD - 9515	
Description	When creating an I2 Presentation Notification from the Trader Portal after submitting an H1 declaration, the procedure codes were being cleared from the goods item entries,

	and when re-entered manually, the system would incorrectly fail with a "DutyTaxFree value is required" validation error.
Fix	The system was updated to properly retain procedure codes when generating I2 Presentation Notifications and to correctly handle the validation of duty/tax information based on these codes.
Impact	Traders can now successfully submit I2 Presentation Notifications without having to manually re-enter procedure codes.

14.34   H6 declarations with multiple goods items stuck in "Received - Pending Validation" state

Ref: FT – 34510	
Description	When submitting an H6 declaration with ten goods items, the declaration would become stuck in the "Received - Pending Validation" state without displaying any error messages, preventing users from proceeding with the declaration process.
Fix	The system was updated to properly handle country field population in complex H6 declarations with multiple goods items, resolving an issue that was causing declarations to fail.
Impact	Users can now successfully submit and process H6 declarations with multiple goods items.

14.35   G3 declarations accepting invalid values for Type of Location field.

Ref: FT – 34500, PSD - 9402	
Description	The system was accepting G3 declarations with invalid values in the Type of Location field, despite specifications requiring format 'a1' with only valid values being 'A', 'B', 'C', or 'D'.
Fix	Validation rules were implemented to properly check the Type of Location field in G3 declarations, ensuring only the allowed single-character values ('A', 'B', 'C', or 'D') are accepted.
Impact	The system now correctly validates the Type of Location field in G3 declarations according to specifications.

14.36   H5 declarations with PoUS references at header level were automatically released without required manual review

Ref: FT – 34290	
Description	When users submitted H5 declarations with Proof of Union Status (PoUS) references in data element 12.03 at the header level, the system was incorrectly processing them for automatic release instead of sending them for manual handling.
Fix	The validation system was updated to properly identify and route H5 declarations with PoUS references at header level for manual handling.
Impact	All H5 declarations with PoUS references now correctly trigger manual handling workflows.

14.37   Users unable to enter weight information when requesting disposal of G4 declarations

Ref: FT – 34267, PSD - 9177	
Description	When attempting to request disposal of a G4 declaration, users were unable to add weight information in the Master Consignment section, despite being able to select a measurement unit.
Fix	The system was updated to properly display and accept weight field inputs during the disposal request process for G4 declarations.
Impact	Users can now successfully complete disposal requests for G4 declarations by entering required weight information, ensuring compliance with declaration requirements.

15 Release 6.1.5.1-RC2

Environment	Release date
PROD	N/A
TFE02	06-03-2025

15.1 Incorrect timer setting for G5 declarations for specified dates.

Ref: FT-34657	
Description	When submitting a G5 declaration with an additional information code DTIME and a specific date (e.g., 2025-02-01), the system was incorrectly setting the timer due date to 1:00 AM on that date (e.g., 2025-02-01 01:00:00) instead of the end of the day.
Fix	The timer functionality was updated to correctly set the due date to the end of the specified date, ensuring proper expiration timing.
Impact	Users can now rely on G5 declaration timers to expire at the appropriate time (end of the specified day), allowing for proper planning and management of time-sensitive customs processes.

15.2 Incorrect format dates on H6 IMZ declarations

Ref: FT-34648	
Description	When submitting an H6 IMZ declaration with additional information code "H6EDT" in field 12 02 008, the system was not properly validating the date format in the corresponding additional information text field (12 02 009), allowing incorrectly formatted dates to be accepted.
Fix	The validation system was updated to properly check that when the additional information code is "H6EDT", the date in field 12 02 009 must follow the format YYYYMMDD.
Impact	Users now receive appropriate validation errors when submitting H6 IMZ declarations with incorrectly formatted dates, ensuring data integrity and preventing processing issues related to invalid date formats.

15.3 Incorrect rejections of declarations with statistical values.

Ref: FT-34644	

Description	H1, H2, and H4 declarations with statistical values exceeding 115,000 DKK (approximately 15,000 EUR) were being incorrectly rejected by the system, despite this limitation being applicable only to H5 declarations.
Fix	The validation rule BR10002_006 was modified to correctly apply the statistical value limitation only to H5 declarations, as required by regulations.
Impact	Users can now successfully submit H1, H2, and H4 declarations with statistical values over 115,000 DKK without incorrect rejections, allowing for proper processing of higher-value imports through these declaration types.

15.4 UI breakage when accessing document on TP

Ref: FT-34622, PSD-9458	
Description	When users clicked on the three-dots menu to select an attached document in the Declaration Overview section of Trader Portal, the user interface would break, preventing them from viewing the entire "Upload" button and properly interacting with document options.
Fix	The user interface rendering issue in the document selection menu was resolved, ensuring proper display of all document action buttons.
Impact	Users can now consistently access and interact with document options in the Trader Portal without experiencing UI breakage, allowing for smooth document management across all declaration types.

15.5 Technical error during CERTEX certificate validation.

Ref: FT-34588	
Description	When declarations with CERTEX certificate information were submitted, the system was creating "Handle Technical Error" work tasks during authorization validation without providing clear error messages or reasons for the validation failure.
Fix	The configuration issue in the CCN2 adapter was resolved by updating the namespace for the callback method, ensuring proper communication between the CERTEX emulator and the system.
Impact	Users now receive proper error information when CERTEX validation encounters issues, allowing for appropriate

	troubleshooting and resolution of certificate-related problems during the declaration process.

15.6 Incorrect rejection of Transit declarations.

Ref: FT-34567	
Description	Transit declarations containing valid C521 authorization codes were being rejected by the system with error code 12 (CL235), despite the authorization being properly registered and valid in DK-CRS.
Fix	The system's reference data retrieval process was corrected to properly import and update the codelist containing C521 authorization codes from CSRD2, ensuring valid authorizations are recognized during validation.
Impact	Users can now successfully submit Transit declarations with valid C521 authorizations without experiencing incorrect rejections, streamlining the declaration process for authorized Transit operators.

15.7 Rejections when procedure code is valid for H5 declaration.

Ref: FT-34558	
Description	When submitting H5 declarations with the procedure code combination of Requested Procedure (11 09 001 000) = 61, Previous Procedure (11 09 002 000) = 21, and Additional Procedure (11 10 001 000) = B01, users received rejection errors stating "The combination of Requested procedure, Previous Procedure, and Additional procedure is not allowed."
Fix	The system's reference data was updated to include the missing procedure code combination '6121B01' in codelist 50110, allowing the valid procedure combination to be accepted.
Impact	Users can now successfully submit H5 declarations with the specified procedure code combination, enabling proper processing of goods under this particular customs scenario.

15.8 Rejection when using valid additional procedure code for H5 declaration.

Ref: FT-34557	
Description	When submitting H5 declarations with the additional procedure code B01 as part of a valid procedure combination (Requested Procedure 61, Previous Procedure 10, Additional Procedure B01), users received rejection errors stating "value

	'B01' at 'GoodsItem.specialProcedures.code' does not exist in '11040'".
Fix	The system's reference data was updated to include the missing procedure code combination '6121B01' in codelist 50110, allowing the valid procedure combination to be accepted.
Impact	Users can now successfully submit H5 declarations with the specified additional procedure code B01 in combination with requested procedure 61 and previous procedure 10, enabling proper processing of goods under this particular customs scenario.

15.9 Inconsistent display of goods item status after partial release.

Ref: FT-34545	
Description	After performing a partial release where some goods items were released and others detained, the TP UI failed to display the correct status of goods items.
Fix	An updated to correctly display the status of goods items after partial release, ensuring consistency with the TP UI and KRIA systems.
Impact	Customs officers and users can now see accurate and consistent goods item status information across all interfaces after partial release operations, with released items clearly marked as "Goods item released" and detained items marked as "deleted" in TP.

15.10   Inconsistent display of goods item after partial release.

Ref: FT-34544	
Description	When performing a partial release in KRIA where some goods items were released and others withheld awaiting documentation from another authority, the status of goods items was only visible in the TP UI.
Fix	An updated to correctly display the status of goods items during partial release, ensuring consistency with the TP UI.
Impact	Customs officers and users can now see accurate and consistent goods item status information across all interfaces during partial release operations, with released items clearly marked as "OK to release" and withheld items marked as "partial release started" in TP.

15.11 Submit I2EIDR declarations without goods location information.

Ref: FT-34527, PSD-9403	
Description	When submitting I2EIDR declarations with goods location elements, the system was not correctly validating the sub-elements according to the specified identification code, allowing declarations with inconsistent or incomplete location information to be accepted.
Fix	The validation system was updated to properly enforce the relationship between the goods location identification code and its required sub-elements, ensuring that only the appropriate elements for each identification code are accepted.
Impact	Users now receive appropriate validation feedback when submitting I2EIDR declarations with goods location information, ensuring data consistency and preventing potential processing issues related to incomplete or contradictory location data.

15.12 Submit G3 declarations without previous document information.

Ref: FT-34520, PSD-9410	
Description	When submitting G3 declarations, the system was not validating whether the previous document type was declared or whether it was a valid document type, despite this being a mandatory field according to requirements.
Fix	The validation system was updated to properly enforce the requirement for a valid previous document type when submitting G3 declarations.
Impact	Users now receive appropriate validation errors when submitting G3 declarations without the required previous document type information, ensuring compliance with declaration requirements and preventing potential processing issues.

15.13 Inconsistent input behaviour when entering customs office information.

Ref: FT-34507, PSD-9440	
Description	When creating G3 presentations in the Trader Portal UI, the Customs office reference number field (16 15 047 001) was implemented as a regular text input rather than an autocomplete field, contrary to the user interface design specifications.

Fix	The Customs office reference number field was updated to function as an autocomplete field, providing users with suggestions as they type.
Impact	Users now experience a more consistent and user-friendly interface when entering customs office information, with autocomplete functionality helping to prevent errors and improve data entry efficiency in G3 declarations.

15.14 Danish translate UI element for DMS Import.

Ref: FT-34503, PSD-9423	
Description	In the Overview tab of DMS Import, the label "Task (DK)" was not properly translated to Danish, appearing in English instead of the expected Danish translation "Opgaver".
Fix	The translation for the task section header was updated to correctly display "Opgaver" in the Danish version of the interface.
Impact	Danish users now experience a fully translated and consistent interface when viewing the Overview tab in DMS Import, improving user experience and comprehension.

15.15 Danish translate UI element for DMS Online.

Ref: FT-34501	
Description	When viewing import declarations in DMS Online/TP, the title for Group 14 (Calculation Information) was not properly translated to Danish, while the same element was correctly translated in the DMS Import interface.
Fix	The translation for the task section header was updated to correctly display "Opgaver" in the Danish version of the interface. The translation for Group 14 was updated to consistently display "Beregningsoplysninger" in the Danish version of the DMS Online/TP interface.
Impact	Danish users now experience a fully translated and consistent interface when viewing calculation information in import declarations across both DMS Online/TP and DMS Import interfaces.

15.16 Danish translation for TARIC code identifier for DMS Online.

Ref: FT-34499	
Description	When viewing import declarations in DMS Online, the field label "(09 058) [6/15] TARIC code Identifier (DK)" in Group

	16 (Location, Countries, and Origin) was not properly translated to Danish.
Fix	The translation for the TARIC code identifier field was updated to correctly display "Taric kode (18 09 058 000)" in the Danish version of the interface.
Impact	Danish users now experience a fully translated interface when viewing TARIC code information in import declarations, improving user experience and comprehension.

15.17   Authorization terminology for DMS Online.

Ref: FT-34498	
Description	When creating I2EIDR declarations in DMS Online/TP, the dropdown menu for authorization codes (based on codelist CL10274) used inconsistent terminology, displaying "Tilladelse" (permission) instead of the correct term "Bevilling" (authorization) and containing text that did not match the official TARIC descriptions.
Fix	The Danish translations in codelist CL10274 were updated to match the official TARIC terminology, replacing "Tilladelse" with "Bevilling" and aligning the descriptions with the official TARIC texts.
Impact	Danish users now see consistent and officially correct terminology when working with authorization codes in I2EIDR declarations, improving clarity and reducing potential confusion about authorization types.

15.18   Incorrect mapping of customs office information in G3 declaration.

Ref: FT-34497, PSD-9390	
Description	When submitting G3 declarations via Trader Portal UI, the presentation customs office (data element 17 09 000 000) was incorrectly mapped to the supervising office field in the resulting XML, causing declarations to be rejected due to violation of business rule BR255_040.
Fix	The system was updated to correctly map the presentation customs office data to the appropriate field in the XML structure for G3 declarations.
Impact	Users can now successfully submit G3 declarations through the Trader Portal UI with proper customs office information, allowing for correct processing of these declarations without rejection errors related to BR255_040.

15.19 Danish translation for country information on DMS Online.

Ref: FT-34494	
Description	When viewing import declarations in DMS Online/TP, the field label "country Of Dispatch Code (DK)" in Group 16 (Location, Countries, and Origin) was not properly translated to Danish.
Fix	The translation for the country of dispatch field was updated to correctly display "Afsendelsesland (16 06 000 000)" in the Danish version of the interface.
Impact	Danish users now experience a fully translated interface when viewing country information in import declarations, improving user experience and comprehension across both declaration and goods item levels.

15.20 Persistent timers for cleared Temporary Storage declarations.

Ref: FT-34486, PSD-9346	
Description	When a Temporary Storage declaration was cleared through disposal of goods, the "PRM - Time Window for Temporary Storage" timer remained active in the system, despite the declaration proceeding to clearance status.
Fix	The system was updated to properly deactivate the Temporary Storage timer when a declaration is cleared through disposal of goods.
Impact	Users now see accurate timer status information, with Temporary Storage timers being automatically deactivated when declarations are cleared, preventing confusion and ensuring proper system cleanup of timer resources.

15.21 Incorrect enable Bill of Discharge for H3 declarations.

Ref: FT-34426, PSD-9332	
Description	The system was incorrectly allowing users to enable the Bill of Discharge option when processing H3 declarations with procedure code 8f, resulting in unnecessary CWMBOD notifications being sent to traders and inappropriate timer activations, despite Bill of Discharge not being applicable to H3 declarations.
Fix	The system was updated to prevent the enabling of Bill of Discharge functionality for H3 declarations, ensuring that the Bill of Discharge checkbox cannot be selected when processing these declarations.

Impact	Users now experience appropriate behavior when processing H3 declarations with procedure code 8f, without the possibility of inadvertently triggering irrelevant Bill of Discharge notifications or timers, resulting in a more accurate customs process.

15.22   Amend quota information in declarations.

Ref: FT-34419, PSD-9315	
Description	When attempting to amend a declaration to change the Quota Order ID (99 01 001 000) from one value to another (e.g., from 000006 to 000009), users found that the current quota value was invisible in the amendment interface and the system did not process the requested change.
Fix	The system was updated to properly display and process quota information during declaration amendments, ensuring that the current quota value is visible and can be modified.
Impact	Users can now successfully view and modify quota information when submitting amendment requests, allowing for proper adjustments to quota-related data in declarations after initial submission.

15.23   Error when presenting H3 declarations in Manifest.

Ref: FT-34418, PSD-9314	
Description	When attempting to create a presentation for a pre-lodged H3 declaration in Manifest, the process would fail with error status 9 and message "DMS-Import reference is not known or in wrong status". This occurred because DMS was sending status code 0 in the IEI79A response instead of the expected status code 3.
Fix	The system was updated to correctly handle the status codes in the communication between DMS and Manifest when processing H3 declaration presentations.
Impact	Users can now successfully present pre-lodged H3 declarations through Manifest without encountering status errors, allowing for proper processing of these declarations in the customs workflow.

15.24   G4G3 declaration didn't set task to complete.

Ref: FT-34415, PSD-9308	

Description	After acceptance of a G4G3 declaration and completion of the Manual Calculation of Remaining Days work task, the system was not setting the task to complete.
Fix	The system was updated to properly trigger the complete task for the G4G3 declaration.
Impact	G4G3 declarations now correctly proceed through the workflow.

15.25 Incorrect data elements in the Additional references section.

Ref: FT-34405, PSD-9784	
Description	When working with declarations in the Trader Portal UI, users found that the Additional References section (12 04) contained invalid data elements that are not part of the European Union Customs Data Model (EUCDM), specifically elements 12 03 010, 12 03 011, 12 03 013, and 12 12 080.
Fix	The Trader Portal UI was updated to remove the invalid data elements from the Additional References section, ensuring alignment with the EUCDM requirements.
Impact	Users now see only the correct and EUCDM-compliant data elements when working with Additional References in declarations, improving data accuracy and reducing potential confusion during the declaration process.

15.26 Incorrect auto-population in G3 declarations.

Ref: FT-34402, PSD-9370	
Description	When creating G3 declarations in the Trader Portal UI, entering data in either the representative party identification (D. E. 13 06 017 000) field or the person presenting goods identifier field (D. E. 13 11 017 000) would automatically populate the other field with the same value, despite these being separate and distinct data elements.
Fix	The system was updated to properly separate the representative party identification and person presenting goods identifier fields, ensuring that data entered in one field does not automatically populate the other.
Impact	Users can now independently enter different values for representative party identification and person presenting goods identifier when creating G3 declarations, allowing for accurate representation of these distinct roles in the customs process.

15.27   Amendment information for Consignor Name.

Ref: FT-34399, PSD-9283	
Description	When traders requested corrections to the Consignor Name (D.E. 13 02 016 000) in the TP UI, the amendment details were not properly displayed in the resulting customs officer work task or in the Additional Messages section, despite the changes being correctly applied to the declaration.
Fix	The system was updated to properly include Consignor Name amendment details in the work task and additional messages views, ensuring visibility of these changes in the amendment approval process.
Impact	Customs officers can now see complete and accurate information about Consignor Name amendment requests in work tasks, allowing for proper review and approval of these changes while maintaining a clear audit trail of declaration modifications.

15.28   Incorrect control state display after completed for declaration.

Ref: FT-34389, PSD-9224	
Description	When a declaration underwent risk assessment that triggered a control, the control state would be set to "In Progress" but would not update to reflect the completed status even after the control task was closed and the declaration was fully processed according to the control result.
Fix	The system was updated to properly update the control state when control results are received and processed, ensuring that the displayed state accurately reflects the current status of the declaration.
Impact	Users now see accurate control state information throughout the declaration lifecycle, with the state properly transitioning from "In Progress" to the appropriate final state once controls are completed, providing better visibility into the declaration's processing status.

15.29   Rejection error when presenting H1 with G3 declarations

Ref: FT-34375	
Description	When attempting to present an H1 declaration using a G3 presentation notification, users encountered rejection errors citing violation of business rule BR255_040 (requiring a

	presentation customs office), even when the appropriate office information was provided.
Fix	The system was updated to correctly map and process the presentation customs office information in G3 declarations, ensuring proper association with the related H1 declaration during the presentation process.
Impact	Users can now successfully present H1 declarations using G3 presentation notifications without encountering incorrect rejection errors, allowing for smooth processing of import declarations through the customs workflow.

15.30 Missing transport equipment information in trader portal.

Ref: FT-34362, PSD-9250	
Description	When submitting G4 or G4G3 declarations with transport equipment information at the Master Consignment level, this information was missing in the Trader Portal UI due to incorrect mapping.
Fix	The system was updated to properly map and display transport equipment information (19 07) in the Trader Portal UI for G4 and G4G3 declarations.
Impact	Users now see consistent transport equipment information across Trader Portal for G4 and G4G3 declarations, ensuring complete visibility of all declaration data regardless of which interface is used.

15.31 Missing correction request for G4G3 declaration

Ref: FT-34360, PSD-9241	
Description	When submitting a request for correction to update the Consignor Name (D.E. 13 02 016 000) in a G4G3 declaration through the Manifest UI, the request was not appearing in the "Request for Correction" overview, making it impossible to track or process the change.
Fix	The system was updated to properly record and display correction requests for Consignor Name in G4G3 declarations in the "Request for Correction" overview.
Impact	Users can now successfully submit, track, and process requests for correction to Consignor Name information in G4G3 declarations, with all requests properly appearing in the overview interface for processing.

15.32   Incorrect cash payment tasks for H1 declarations with valid guarantees.

Ref: FT-34357	
Description	All H1 declarations were generating cash payment work tasks despite importers and declarants having valid tax collateral (skatssikkerhedsstillelse) for existing customs debts, causing unnecessary workflow interruptions.
Fix	The system was updated to properly recognize and respect existing guarantees, preventing the creation of unnecessary cash payment work tasks when valid guarantees are in place.
Impact	Users with valid guarantees now experience a smoother declaration process without interruptions from unnecessary cash payment tasks, allowing for more efficient processing of H1 declarations with guaranteed payment arrangements.

15.33   Danish translation for transport identity field.

Ref: FT-34344	
Description	In the Danish version of the Trader Portal UI, data element 19 06 061 (identity of means of transport) was incorrectly translated as "method of transport" instead of the correct term "Type af transport-ID."
Fix	The Danish translation for data element 19 06 061 was updated to correctly display "Type af transport-ID (19 06 061 000)" in both the Trader Portal and CWM Manifest interfaces.
Impact	Danish users now see consistent and accurate terminology for the transport identity field across all interfaces, improving clarity and reducing potential confusion when working with G4, G4G3, and G5 declarations.

15.34   Incorrect control state display after partial release.

Ref: FT-34338, PSD-9208	
Description	When performing a partial release and reporting all control results, the Control State remained stuck as "In Progress" instead of updating to "Finalized".
Fix	The system was updated to properly update the Control State to "Finalized" when all control tasks are closed and goods items are released after a partial release operation.
Impact	Users now see accurate Control State information that properly reflects the completed status of control operations

following partial release, providing better visibility into the current processing status of declarations.

15.35 Lost amounts when submitting declarations.

Ref: FT-34325, PSD-9217	
Description	When creating H1 declarations in the Trader Portal UI, manually added amounts in the "Tillæg og fradrag" field (14 04 000 000 - Additions and Deductions) were removed upon submission of the declaration, resulting in loss of important valuation data.
Fix	The system was updated to properly preserve and process manually entered adjustment amounts when submitting declarations through the Trader Portal UI.
Impact	Users can now successfully include additions and deductions to the customs value when submitting declarations, with these amounts being properly retained throughout the submission process and correctly displayed in the final declaration.

15.36 Incorrect validation of delivery terms information.

Ref: FT-34318	
Description	When submitting declarations with delivery terms information, the system was incorrectly requiring both UN/LO-CODE and country/location information.
Fix	The validation system was updated to correctly implement the EUCDM rules for delivery terms, allowing declarations with either a valid UN/LOCODE or country and location information, but not requiring both.
Impact	Users can now submit declarations with delivery terms information that follows the EUCDM guidelines, providing either UN/LOCODE or country and location details as appropriate, without encountering incorrect validation errors.

15.37 G3 declaration with invalid previous document references.

Ref: FT- 34272, PSD-9236	
Description	Incorrectly accepting G3 presentation notifications that contained invalid previous document references.
Fix	The validation system was updated to properly check the validity of previous document references in G3 presentations,

	ensuring that references to inappropriate document types are rejected.
Impact	Users now receive appropriate validation errors when attempting to submit G3 presentations with invalid document references.

15.38   Missing field labels in G3 declaration.

Ref: FT-34271, PSD-9230	
Description	When creating G3 presentation notifications in the Trader Portal UI, some data fields in Group 13 were missing their titles/labels, making it difficult for users to identify what information should be entered.
Fix	The user interface was updated to properly display titles and labels for all data fields in G3 declaration forms.
Impact	Users now see clear and consistent labels for all data fields when creating G3 presentation notifications in the Trader Portal, improving usability and reducing potential confusion during the data entry process.

15.39   Could not enter weight when disposing of G4 declaration.

Ref: FT-34267, PSD-9177	
Description	When requesting to dispose of a G4 declaration, users were unable to add weight information in the disposal request form, as the system only allowed them to select a measurement unit without providing a field to enter the actual weight value.
Fix	The disposal request form for G4 declarations was updated to include the necessary field for entering weight values, while maintaining the existing ability to select the measurement unit.
Impact	Users can now successfully complete disposal requests for G4 declarations by entering both the weight value and measurement unit, enabling proper tracking and accounting of disposed goods in the system.

15.40   Update error messages when submitting H1 declaration.

Ref: FT-34211, PSD-9103	
Description	When submitting H1 declarations with certain data issues, particularly related to entries in Goods Item 1 - DE 14 03 that

	contained only a sequence number without other required information, users received generic error messages with no indication of what fields needed correction.
Fix	The validation system was updated to properly handle cases where data elements contain entries with only sequence numbers, now providing specific error messages that indicate which fields need to be corrected.
Impact	Users now receive clear and informative error messages when submitting H1 declarations with data issues.

15.41 Incorrect rejection of amendment request.

Ref: FT-34201, PSD-9226	
Description	When submitting amendment requests to change permitted data elements like gross mass in an H1 declaration, the system was incorrectly rejecting these requests, despite these changes being allowed according to requirements.
Fix	The validation system was updated to correctly process amendment requests for permitted data elements, including gross mass, ensuring that only truly non-amendable elements trigger rejection errors.
Impact	Users can now successfully submit amendments to change permitted data elements in H1 declarations, with the system properly creating work tasks for handling these amendment requests rather than incorrectly rejecting them.

15.42 Incorrect rejection of H3 IMZ declaration with valid guarantees.

Ref: FT-34194	
Description	When submitting H3 IMZ declarations with Guarantee Type, the system was incorrectly rejecting these declarations with error DK2044, claiming the declarant did not have a valid guarantee authorization.
Fix	The validation system was updated to correctly check for comprehensive guarantee authorizations by validating the qualification reference number.
Impact	Users can now successfully submit H3 IMZ declarations with comprehensive guarantees when they have valid DKCGU authorizations in DK-CRS, without encountering incorrect rejection errors related to guarantee validation.

15.43   Payment tasks for H3 declarations.

Ref: FT-34192	
Description	When submitting H3 declarations with Guarantee Type I, the system was incorrectly creating manual cash payment tasks of 10 DKK, despite this not being required for declarations with this guarantee type.
Fix	The system was updated to properly recognize when a declaration uses Guarantee Type I and to correctly bypass the creation of manual payment tasks in these cases.
Impact	Users submitting H3 declarations with Guarantee Type I now experience a streamlined process with automatic release, without being interrupted by unnecessary manual payment tasks, improving efficiency and reducing administrative overhead.

15.44   Guarantee amount field in H1 declaration.

Ref: FT-34189, PSD-9098	
Description	The "Amount to be covered" field (99 03 071 000) in the guarantee section had several issues: the data element number was missing, the description text was truncated, and the field used a number picker that allowed negative values instead of the required numeric format.
Fix	The guarantee amount field was updated to correctly display the complete field reference number, show the full description text, and implement proper numerical input that follows the EUCDM format requirements without allowing negative values.
Impact	Users now experience a more consistent and standards-compliant interface when entering guarantee amount information in H1 declarations, with clear field identification, complete descriptions, and proper validation of numerical input.

15.45   Document line item number not displayed during corrections

Ref: FT-34169, PSD-9079	
Description	When users requested corrections to declarations, the Document line item number (12 03 013 000) data that was previously entered was not being displayed in the correction form.
Fix	The system was updated to properly display the Document line item number data when viewing or correcting declarations.

Impact	Users can now see previously entered Document line item number data when making corrections to declarations, ensuring continuity and accuracy in document references throughout the correction process.

15.46   Amendments to Goods Registration Entries could not be processed

Ref: FT- 34114	
Description	Users were unable to submit amendments to Goods Registration Entries (GREs) as the system was incorrectly rejecting them due to business rule BR168_003, even when the amendments were valid.
Fix	The system was updated to correctly configure business rule BR_VALI_10015_42 to allow valid amendments to Goods Registration Entries.
Impact	Users can now successfully submit amendments to Goods Registration Entries, such as changes to gross mass values, enabling proper correction of information after initial submission.

15.47   Customs office field lacked autocomplete functionality

Ref: FT- 34025, PSD-9086	
Description	The Customs office field (16 15 047 000) in the Trader Portal was implemented as a free-text field instead of providing autocomplete functionality, making it difficult for users to select valid office codes.
Fix	The system was updated to implement autocomplete functionality for the Customs office field, allowing users to select from a dropdown list of valid options.
Impact	Users can now more efficiently enter customs office information with reduced errors by selecting from a filtered list of valid options as they type, improving data entry speed and accuracy.

15.48   H1 Invalidation and remission requests incorrectly rejected

Ref: FT- 33935	
Description	When submitting a H1 invalidation and remission (4C) request, users received validation errors citing business rule BR_ADDM_0206_010.
Fix	The underlying issue was fixed.

Impact	Users can now successfully submit invalidation and remission requests without encountering misleading validation errors, streamlining the process for requesting duty refunds and declaration invalidations.

15.49   Manual release task not created for diplomatic goods

Ref: FT- 33915	
Description	The system was not generating the required "Manual Release" task for declarations with diplomatic goods (procedure code 40 with additional code 800), preventing proper customs processing of these special shipments.
Fix	The underlying issue was fixed.
Impact	Declarations containing diplomatic goods now correctly generate manual release tasks.

15.50   H4 pre-lodged declarations with valid warnings incorrectly rejected

Ref: FT- 33867	
Description	The system was incorrectly treating non-rejecting warnings on H4 pre-lodged declarations (such as "Bill of discharge is required") as rejecting errors, preventing Manifest from properly processing arrival declarations.
Fix	The system was updated to correctly distinguish between rejecting and non-rejecting warnings, particularly for warning code DK_INT_0332, ensuring that declarations with only non-rejecting warnings can proceed through arrival processing.
Impact	Declarations with non-rejecting warnings can now be properly processed through the Manifest system for arrival, eliminating unnecessary rejections and streamlining the goods arrival process.

15.51   Declaration rejections lacked clear error messages

Ref: FT- 33754, PSD-8803	
Description	When I1 declarations were rejected, the system was not providing specific error codes or reasons for the rejection, making it difficult for users to understand and fix the issues.
Fix	The system was updated to include clear error codes and descriptions in rejection messages, both in the interface and in CWMREJ notifications.

Impact	Users now receive detailed information about why their declarations are rejected, allowing them to quickly identify and correct issues without having to contact support for clarification.

15.52   Duplicate field in 8F applications caused decision errors

Ref: FT- 32687	
Description	When attempting to grant 8F applications in declarations, the system was displaying an error about missing information in data element 4/17, even though the information was correctly entered in another instance of the same field.
Fix	The system was updated to eliminate the duplicate data element 4/17 field, ensuring that entered information is correctly recognized during the decision process.
Impact	Customs officers can now successfully grant 8F applications without encountering misleading errors about missing information, streamlining the processing of end-use authorizations.

15.53   Declarations with valid guarantees incorrectly triggered manual payment tasks

Ref: FT- 32574, PSD-8700	
Description	The system was incorrectly creating manual cash payment tasks for declarations that had valid guarantees, particularly affecting H2 declarations with dummy guarantees that satisfied business rules BR775 and BR776.
Fix	The system was updated to correctly recognize and process dummy guarantees, ensuring that declarations with sufficient guarantee coverage do not trigger unnecessary manual payment tasks.
Impact	Declarations with valid guarantees now proceed through the customs process without requiring unnecessary manual payment intervention, streamlining the clearance process for traders who have provided proper guarantee coverage.

15.54   Postal value field missing from H6 declarations

Ref: FT- 31964, PSD-7835	
Description	The data element 14 12 000 000 (Postal value) and its sub-elements were not visible in the Trader Portal interface for H6

	declarations, preventing users from entering this required information.
Fix	The system was updated to properly display the Postal value field and its sub-elements (Currency and Amount) in the Trader Portal interface for H6 declarations.
Impact	Users can now enter postal value information when creating H6 declarations, ensuring compliance with data requirements for postal shipments and enabling proper customs valuation.

16   Release 6.1.5-final

Environment	Release date
PROD	N/A
TFE02	30-01-2025

16.1 Error code: OE0007 when entering Goods Accounting of a Rejected declaration

Ref: PSD-7701	
Description	An error appears when going to the Goods Accounting tab on a rejected H3 declaration.
Fix	The underlying issue was fixed.
Impact	No error shows up anymore when going to said tab.

16.2 All amendments are accepted even though they should only be partially accepted

Ref: PSD-6161	
Description	When making multiple amendments where some are accepted and others are rejected, the solution accepts all the amendments instead of just the ones which were accepted.
Fix	The underlying issue was fixed.
Impact	The correct status for the individual amendments are now shown.

16.3 Missing data for Region of Destination CL10202

Ref: PSD-7249	
Description	The "Region of Destination" field (16 04 001 000) was displayed as an empty text field instead of a drop-down menu on goods shipment level. The same field on Goods Item level had the wrong code list attached to it so regardless of what was picked from it, it would cause a rejection when any country was picked from the list.
Fix	Region of destination was changed to a free text field on both levels and the correct code list is used when checking the field.
Impact	The "Region of Destination" field now functions correctly on both levels, preventing declaration rejections.

16.4 'Postal value' field not visible for H6 in Trader Portal UI

Ref: PSD-7835	
Description	The 'Postal value' field (D.E. 14 12 000 000) and its sub-elements were not visible in the TP UI for H6 declarations.
Fix	The underlying issue was fixed.
Impact	Users can now see and edit the 'Postal value' field and its sub-elements in the Trader Portal UI for H6 declarations, ensuring all necessary information is accessible.

16.5 When sending a H6 wrong D.E. is shown in Trader Portal UI

Ref: PSD-7464	
Description	According to EUCDM, D.E 13 14 031 000 refers to additional supply chain actor role. However, when creating a H6 declaration in TP UI, the additional supply chain actor role is displayed as D.E 13 16 031 000.
Fix	The underlying issue was fixed.
Impact	Additional supply chain actor role is referred to as D.E. 13 14 031 000

16.6 Additional declaration type not updated in UI after successful I2 GPR submission

Ref: PSD-7472	
Description	When submitting an I1 IM/E declaration, the additional declaration type did not change in the Trader Portal UI after a successful I2 GPR submission. It remained as IM/E instead of updating to IM/B.
Fix	The underlying issue was fixed.
Impact	The additional declaration type now correctly updates to IM/B in the TP UI after a successful I2 GPR submission.

16.7 Unable to amend H1 due to missing "taricCodeIdentifier" field

Ref: PSD-7823	

Description	In Trader Portal UI when attempting to amend an H1 declaration by adding or correcting goods items, the "taricCodeIdentifier" field was missing, preventing the completion of the amendment.
Fix	The underlying issue was fixed.
Impact	Users can now successfully amend H1 declarations in the TP UI, including adding or correcting goods items with the "taricCodeIdentifier" field visible and editable.

16.8 When sending a H1 a wrong codelist is used for Invoice currency

Ref: PSD-7555	
Description	When a H1 standard declaration is sent in the Trader Portal UI the Invoice currency field in group 14 shows options from the wrong codelist, displaying other units not pertaining to currency.
Fix	The underlying issue was fixed.
Impact	The drop down menu in "Invoice currency" shows a correct list of currency types.

16.9 Unable to remove 8f applications during Trader Portal submission

Ref: PSD-7532	
Description	When submitting a declaration with an attached 8f application in the Trader Portal UI, users were unable to remove the application before submission.
Fix	The underlying issue was fixed.
Impact	Users can now delete 8f applications before submitting a declaration in the Trader Portal UI, providing greater flexibility and control over the submission process.

16.10   DMS reports incorrect state to Manifest.

Ref: FT-34422	
Description	When presenting goods via Manifest, DMS incorrectly reported that the declaration was not in a state where presentation is allowed, even though it was.
Fix	The underlying issue was fixed.
Impact	DMS now correctly reports the state of the declaration to Manifest, allowing the presentation of goods to proceed without errors.

16.11　Misspelling in error message for amendment of temporary storage declarations.

Ref: PSD-9205	
Description	The error message "Fetch Extenderd Declaration Failed" displayed when trying to amend G4 and G4G3 declarations in Manifest UI was misspelled.
Fix	The underlying issue was fixed.
Impact	The error message is now correctly spelled as "Fetch Extended Declaration Failed," ensuring clarity and professionalism in the user interface.

16.12　B1 (export) Invalidation Reason Code 122 is not visible from Codelist

Ref: FT-34314	
Description	When creating an Invalidation Request for a B1 export declaration, Reason Code 122 is not visible, and is still shown as 22.
Fix	The underlying issue was fixed.
Impact	It is possible to choose reason Code 122 from the code list.

16.13　Cannot fill Delivery Items form for H4 after initial rejection.

Ref: PSD-9192	
Description	When a declaration gets rejected due to BR255_097 (Delivery Terms are missing), the user should be able to fill the Delivery Items form and amend the rejection. However, after filling the fields and submitting the declaration, the new fields were not passed, and the declaration could not be amended.
Fix	The underlying issue was fixed.
Impact	Users can now successfully amend H4 declarations by filling the Delivery Items form after an initial rejection, ensuring that the fields are correctly passed and the declaration can be amended.

16.14　Negative Numbers for number of packages does not give a warning

Ref: PSD-9168	
Description	When sending a G4 declaration and using negative numbers for number of packages, no warning or rejections is given.
Fix	The underlying issue was fixed.

Impact	Declarations with negative numbers in Number of Packages (18 06 004 000) gets rejected.

16.15   Discharging H3 with previous document referencing a G4G3 fails.

Ref: FT-34257	
Description	When discharging an H3 declaration with a previous document referencing a G4G3 declaration, the process fails due to missing number of packages and package type, triggering BR10014_019_1 validation error.
Fix	The underlying issue was fixed.
Impact	Users can now successfully discharge H3 declarations with previous document referencing a G4G3 declaration without encountering validation errors related to missing number of packages and package type.

16.16   Possible to accept both invalidation and manual cash payment.

Ref: PSD-9077	
Description	It was possible to grant both the invalidation request and manual cash payment work tasks simultaneously, leading to the financial settlement message being sent for collection of guarantee/duties even though the declaration was invalidated.
Fix	The underlying issue was fixed.
Impact	The system now correctly stops all tasks when an invalidation request is granted, preventing the financial settlement message from being sent inappropriately.

16.17   G4 declaration is rejected if D.E. 11 04 and D.E. 12 01 are not filled.

Ref: FT-34190	
Description	G4 declarations were being rejected if the specific circumstance indicator (D.E. 11 04 000 000) and previous document (D.E. 12 01 000 000) fields were not filled, despite these fields being optional and conditional respectively.
Fix	The underlying issue was fixed.
Impact	Users can now submit G4 declarations without filling D.E. 11 04 000 000 and D.E. 12 01 000 000, aligning with the specified requirements.

16.18   The field Amount to be covered has been implemented wrong.

Ref: PSD-9098	
Description	The field Amount to be covered (99 03 071 000) in H1 declarations had three issues: missing EUCDM reference number, text description not fully visible, and the picker allowed negative values instead of adhering to the n..16,2 format.
Fix	The underlying issue was fixed.
Impact	The field now displays the correct reference number, the text description is fully visible, and the picker adheres to the n..16,2 format, ensuring accurate data entry.

16.19   Document line item number not updated when its corrected.

Ref: PSD-9079	
Description	When correcting a declaration, the data for the "Document line item number" field (12 03 013 000) was not displayed in the Trader Portal UI.
Fix	The underlying issue was fixed.
Impact	The data for the "Document line item number" field is now correctly displayed when correcting a declaration, ensuring that all necessary information is visible to the user.

16.20   The date/time information of Date of validity is displayed inconsistently.

Ref: PSD-9083	
Description	The "Date of validity" field (12 03 011 000) displays different date/time information when creating and correcting a declaration in the Trader Portal UI.
Fix	The underlying issue was fixed.
Impact	The "Date of validity" field now displays the same date/time information consistently during both the creation and correction of a declaration, ensuring accurate and reliable data representation.

16.21   The internal declaration type GRE was accessible through the TP UI and B2B.

Ref: FT-34073	

Description	It was possible to submit a Goods Registration Entry (GRE) through the Trader Portal UI or B2B, which should only be created by customs officers through the internal system.
Fix	The underlying issue was fixed.
Impact	GRE submissions are now correctly restricted, preventing submission through the Trader Portal UI or B2B by unauthorized users.

16.22 Country of Preferential Origin Code is validated incorrectly.

Ref: PSD-9088	
Description	When sending a H1 using "Preference code" 400, the "Country of Preferential Origin Code" (16 09 001) should be validated against Code list 10236. However, it was incorrectly validated against Code list 10203.
Fix	The underlying issue was fixed.
Impact	The "Country of Preferential Origin Code" is now correctly validated against Code list 10236, ensuring accurate validation and allowing the creation of declarations with the correct preference code.

16.23 Sending an Invalidation & Repayment to a H1 triggers an irrelevant business rule.

Ref: FT-33935	
Description	When submitting a H1 end-use declaration and requesting an invalidation and repayment (4c), it would trigger an error message indicating that the validation rule BR_ADDM_0206_010 was not met, even though the fields mentioned in the error were not relevant to the remission data.
Fix	The underlying issue was fixed.
Impact	Users can now successfully request invalidation and remission (4c) for H1 declarations without encountering the erroneous validation rule error.

16.24 Supplementing an I1 IMB is incorrectly rejected.

Ref: PSD-8957	
Description	When supplementing an I1 IMB declaration in the Trader Portal UI after the goods have been released, the supplement was

	rejected with an error indicating a domain error in "declaredDutyTaxFees" despite no changes being made to tis field.
Fix	The underlying issue was fixed.
Impact	Users can now successfully supplement I1 IMB declarations without encountering erroneous rejections related to "declaredDutyTaxFees."

16.25　DE 16 09 001 is validated by the wrong code list.

Ref: PSD-9099	
Description	The "Country of Preferential Origin Code" field (DE 16 09 001) was incorrectly validated against Codelist 10203 instead of the correct Codelist 10236, causing declarations to be rejected despite selecting valid options from the dropdown menu.
Fix	The underlying issue was fixed.
Impact	The "Country of Preferential Origin Code" field is now correctly validated against Codelist 10236, ensuring that valid declarations are accepted.

16.26　The system stuck at accepted when re-using an old I2EIDR.

Ref: PSD-8845	
Description	When re-using an old I2EIDR in parallel submissions of H1 IMZ declarations, the system allowed multiple declarations to be accepted, causing one of the declarations to get stuck at the control state.
Fix	The underlying issue was fixed.
Impact	The system now correctly prevents the re-use of an I2EIDR for multiple declarations, ensuring that only one declaration can proceed, and subsequent attempts are rejected.

16.27　Changing the invoice amount of an I1 using a Supplement causes an error.

Ref: PSD-8792	
Description	When a supplementary declaration was submitted for an I1 declaration via the Trader Portal UI with a changed invoice amount, the system rejected this supplement with a domain error, indicating an invalid value.
Fix	The underlying issue was fixed.

Impact	Users can now successfully change the invoice amount when submitting a supplementary declaration for an I1 declaration, ensuring that updates to the invoice value are accepted.

16.28   Declaration without elements in Location of Goods is accepted

Ref: FT-33768	
Description	An I1 declaration which did not contain mandatory data in Data Element group 16 (16 15) was not rejected as expected.
Fix	The underlying issue was fixed.
Impact	The mandatory data in Data Element group 16 (16 15) is now checked correctly.

16.29   Transport document validation issue

Ref: FT-32640	
Description	The declaration was incorrectly rejected for violating BR255_091 when transport documents were declared at both GS and SI levels.
Fix	The underlying issue was fixed.
Impact	Declarations with transport documents at both GS and SI levels are now correctly accepted.

16.30   Guarantee type incorrectly marked as mandatory with additional procedure A04.

Ref: FT-32563	
Description	The declaration was incorrectly rejected for missing a guarantee type when the additional procedure was A04.
Fix	The underlying issue was fixed.
Impact	Declarations with additional procedure A04 no longer require a guarantee type and are correctly accepted.

16.31   BoD button being double-clicked when trying to fill a new value

Ref: PSD-7838	
Description	The "Apply automatic extension" and "Use bill of discharge" check-boxes were being double-clicked when trying to fill a new value. This meant each time a check-box is clicked once buy the user it is automaticly un-checked again making it verey hard to add to or update these fields.
Fix	The underlying issue was fixed.
Impact	The buttons "Apply automatic extension" and "Use bill of discharge" now function correctly without double-clicking when filling in a new value.

16.32   Black page after request in H5 declaration

Ref: FT-32488	
Description	When sending a H5 Amendment declaration, the page turns black when "Group 14 Valuation Information/Taxes" is clicked.
Fix	The underlying issue was fixed.
Impact	It is possible to navigate to group 14 and request a correction on group 14.

16.33   I1 Amendment cannot be submitted in TP UI

Ref: PSD-7778	
Description	After submitting an I1 declaration via B2B, the amendment of the declaration could not be submitted via TP UI.
Fix	The underlying issue was fixed.
Impact	I1 amendments can now be successfully submitted via TP UI.

16.34   Remove manual acceptance on guarantee type 2 (H3 and H4)

Ref: FT-32455	
Description	H3 and H4 declarations with guarantee type 2 were incorrectly taken out for both manual acceptance and manual release.
Fix	The underlying issue was fixed.
Impact	H3 and H4 declarations with guarantee type 2 now proceed directly to manual release without requiring manual acceptance.

16.35 A2 to discharge goods from a G4G3 is accepted before the 14 days "deadline"

Ref: PSD-7765	
Description	An A2 declaration to re-export goods from a G4G3 was incorrectly accepted before the required 14-day period had passed.
Fix	The underlying issue was fixed.
Impact	A2 declarations are now correctly rejected if submitted within 14 days of the G4G3 submission, ensuring goods are not prematurely discharged from goods accounting.

16.36 After correction work task has been completed user cannot find action correction in TP-UI

Ref: PSD-7758	
Description	When a correction worktask is completed, the action correction is not availabe for the user in TP-UI.
Fix	The underlying issue was fixed.
Impact	The Correction action is available.

16.37 Retrieve notification from different SubmitterID on B2B

Ref: PSD-7772	
Description	Users were able to retrieve notifications from declarations submitted by a different SubmitterID.
Fix	The underlying issue was fixed.
Impact	Users can no longer retrieve notifications from declarations submitted by a different SubmitterID.

16.38 Calculated Customs Debt number is not rounded

Ref: PSD-7242	
Description	When submitting a H1 declaration with customs debt, visiting the customs debt under the customs data tab displays the calculated number with an excessive amount of decimals rather than two decimal points.
Fix	The underlying issue was fixed.
Impact	The calculated customs debt is now restricted to two decimal points.

16.39   Invalid IE512 got stuck when submitting through TP-UI with no pointer

Ref: PSD-7759	
Description	Submitting an invalid IE512 declaration through TP-UI caused the UI to get stuck without providing any pointer error, and resulted in a 500 error code.
Fix	The underlying issue was fixed.
Impact	When submitting an invalid IE512 declaration, a pointer error is now provided, and there is no error code 500.

16.40   Wrong units in Previous Document in Request for Disposal

Ref: PSD-7700	
Description	The items in measurement units and qualifiers list (12 01 005 000) in Previous document contains currencies instead of the correct units.
Fix	The underlying issue was fixed.
Impact	The correct units are displayed.

16.41   List in Amendment reason is automatically cleared

Ref: PSD-7621	
Description	When submitting a Correction declaration, in the Amendment reason, after selecting a reason and typing a character, the search bar is automatically cleared, and the list of reasons disappears.
Fix	The underlying issue was fixed.
Impact	Typing does not clear the search bar and the amendment reasons are listed.

16.42   The Warehouse keeper task is not disabled

Ref: ERMIS-45194	
Description	The warehouse keeper task was incorrectly active when submitting a G4G3 declaration, despite it to be disabled.
Fix	The underlying issue was fixed.
Impact	The warehouse keeper task is now correctly disabled when submitting a G4G3 declaration.

16.43   H3 IMZ accepted despite referring to rejected I2EIDR

Ref: PSD-7660	
Description	When a H3 IMZ declaration is submitted referring to a rejected I2EIDR it gets mistakenly accepted
Fix	The underlying issue was fixed.
Impact	H3 IMZ declarations that refer to a rejected I2EIDR are now correctly rejected.

16.44   CWMINV missing from B1 after receiving Major discrepancies result

Ref: FT-32229	
Description	The CWMINV notification was not sent to the Trader Portal after a B1 was submitted with a major discrepancies result.
Fix	The underlying issue was fixed.
Impact	CWMINV notifications are now correctly sent to the Trader Portal when a B1 declaration is submitted.

16.45   Request for disposal for G3G4 declaration does not register in additional messages

Ref: PSD-7572	
Description	When submitting a request for disposal of goods for a G3G4 declaration, the message did not register in the additional messages.
Fix	The underlying issue was fixed.
Impact	Requests for disposal of goods for G3G4 declarations now correctly register in the additional messages.

16.46   Sending incorrect I1 supplementary to an I1 simplified gets accepted.

Ref: PSD-7481	
Description	Several versions of I1 supplementary which was incorrect with respect to their I1 simplified declaration was accepted.
Fix	The underlying issue was fixed.
Impact	The system now correctly rejects malformed I1 supplementary

16.47 Missing response when sending a IEI86A Create Goods Registration Request

Ref: FT-34424	
Description	When sending a IEI86ACreateGoodsRegistrationRequest without filling in the recetacleIdentificationNumber, a response is expected as it is optional, however, in this case no response is received.
Fix	The underlying issue was fixed.
Impact	A response is sent when the receptacle identification number is not filled in.

17 Release 6.1.5-RC12

Environment	Release date
PROD	N/A
TFE02	30-01-2025

17.1 Sending an invalidation and repayment request through the Trader Portal UI gets it wrongfully rejected.

Ref: PSD-8985, PSD-9253	
Description	When a declaration is invalidated with a 4C invalidation and re-payment request through the Trader Portal the request gets re-jected. It also receives an error message that says a 4C invalidation and repayment request should be sent.
Fix	The underlying issue was fixed.
Impact	The user can now send a 4C invalidation and repayment request through the Trader Portal UI without it being rejected.

17.2 Missing input fields in the Trader Portal UI under Previous documents

Ref: PSD-8796	
Description	When looking under the tab Previous documents of a declaration on Trader portal some of the sub-elements are not repre-sented with a input field. There is also an input field value which does not correspond to a sub-element of Previous document.
Fix	The underlying issue was fixed.
Impact	The tab Previous documents now has input fields for all its sub-elements.

17.3 Incorrect input fields in the Trader Portal UI under Transport Documents

Ref: PSD-8811	
Description	When looking under the tab Transport Documents of a declaration on Trader portal there are input fields for sub-elements which do not belong in the Transport Documents tab.
Fix	The underlying issue was fixed.
Impact	Only the correct sub-elements can be seen under Transport Document.

17.4 Declarations without either UN/LOCODE or country code and location name gets wrongfully accepted

Ref: PSD-9045	
Description	Sending a declaration without UN/LOCODE (14 01 036 000), or location name (14 01 037 000) would wrongfully be accepted. This is incorrect as UN/LOCODE (14 01 036 000) should in general be filled out unless the place the delivery destination does not have a UN/LOCODE then both the country code (14 01 020 000) and location name (14 01 037 000) must be filled out.
Fix	The underlying issue was fixed.
Impact	Declarations with incomplete trade terms (14 01) won't be accepted.

17.5 When using charge type code AK for air transport declarations the air freight is miscalculated.

Ref: PSD-9028	
Description	When using the charge type code (14 04 008 000) AK and transport mode 4 "Air transport" the system calculated the air freight of the package incorrectly.
Fix	The method of calculating air freight was revised.
Impact	The freight amount for declarations are now calculated correctly

17.6 When amending via TP UI, sequence numeric validation error occurs

Ref: PSD-9107	
Description	Submitting a H1 Amendment with a change of the gross mass on a Goods Items to a H1 Declaration via the Trader Portal UI results in a validation error unrelated to the change made.
Fix	The underlying issue was fixed.
Impact	The user would now be able to change the gross mass without receiving a validation error.

17.7 When accepting an invalidation while under manual release the declaration gets stuck

Ref: PSD-8801	

Description	For a H1 declaration under manual release, an invalidation request is submitted via Trader Portal API. The manual release work task changes to status 'interrupted' as expected, but the declaration does not get invalidated.
Fix	The underlying issue was fixed.
Impact	Declarations no longer gets stuck if invalidated while its under manual release.

17.8 An I2 Presentation on a Pre-lodged results in a validation error with Goods Items via Trader Portal UI

Ref: PSD-9048	
Description	Submitting a I2 Presentation with the Goods Item Preferences field filled in on a Pre-lodged via the TP UI causes a validation error stating that the preference is missing.
Fix	The underlying issue was fixed.
Impact	The user would now be able to provide a preference without receiving a validation error

17.9 Improper Deadlines when submitting H3 declarations

Ref: PSD-8812	
Description	When a H3 declaration is submitted with a standing authorization, all the timers after release have a deadline of only 10 days.
Fix	The underlying issue was fixed.
Impact	The deadlines should be proper now.

17.10   Unclear Error Message when invalidating a H1 Standard

Ref: PSD-8963	
Description	When invalidating a H1 standard and adding: 1. In group 8 under toldbeløb 8 add DKK and amount A00 amount 0 2. In group 8 under toldbeløb 8 add DKK and amount B00 amount 6479,2 A undiscernible error message is displayed.
Fix	The error message was changed.

Impact	Will now display an error message displaying:
	"The VII/7 should be larger or equal to the sum of VIII/8 amounts."

17.11   Invalid DE in Supporting Documents 12 03

Ref: PSD- 8807	
Description	The tab 'Supporting Documents 12 03' has DE 12 12 080 which is not supposed to be there and missing the data elements DE 12 03 005, 12 03 006, 12 03 012, DE 12 03 014 and DE 12 03 079
Fix	The underlying issue was fixed.
Impact	The DE 12 12 080 is not seen, whilst DE 12 03 005, 12 03 006, 12 03 012, DE 12 03 014 and DE 12 03 079 are shown.

17.12   Reminder Notification for discharge deadline is setup wrong

Ref: PSD-8765	
Description	When submitting a 'H' declaration with an 8f application the reminder notification is setup incorrectly. When setting the time to discharge to 60 days the reminder notification is set to expire in 59 days when it should be set to the time to discharge minus 30 days.
Fix	The underlying issue was fixed.
Impact	The MAR time window reminder notification is set to expire 30 days prior to the time to discharge set.

17.13   Mapping issues between Previous Document Values on a G4G3 Declaration

Ref: PSD-9035	
Description	When submitting a G4 declaration and then using the assigned MRN for a G3 declaration, the Previous document section under House Consignment (in the G3 Declaration) does not display the previous MRN.
Fix	The underlying issue was fixed.
Impact	The MRN of the G4 Declaration is shown correctly in Previous documents.

17.14   Invalid Data Element in Authorization 12 12

Ref: PSD- 8813	
Description	The tab Authorizations 12 12, shows DE 12 03 010, 12 03 011 and 12 03 013 which are not valid according to EUCDM.

Fix	The underlying issue was fixed.
Impact	DE 12 03 010, 12 03 011 and 12 03 013 are not seen.

17.15   Gross mass is not shown when exporting a H7 declaration to PDF

Ref: PSD- 8814	
Description	When a H7 declaration is exported to PDF, Gross mass is not shown on a declarations level.
Fix	The underlying issue was fixed.
Impact	The Gross Mass is visible in the exported PDF.

17.16   Disappearing declaration for first time users of Trader Portal UI

Ref: PSD-8551	
Description	**This was thought to be fixed on RC11 but failed testing at a later point. The issue should now be resolved.** When a user access TP-UI for the first time they can't upload declarations and the declaration disappear.
Fix	The underlying issue was fixed.
Impact	The declaration is visible and can be submitted the first time the user uploads.

17.17   When entering a G4 in the UI Group 13 13 is Missing Data Elements

Ref: PSD-8616	
Description	When entering a G4 declaration into the Trader Portal UI, DE 13 13 is missing some mandatory elements.
Fix	The underlying issue was fixed.
Impact	The missing DEs are visible both on a Master Consignment level and house consignment level.

17.18   Error message overflows text box when submitting a declaration with invalid data

Ref: PSD-8958	
Description	When submitting a H1 declaration via the Trader Portal UI containing invalid data, the text box containing the error message overflows.
Fix	The underlying issue was fixed.

Impact	The error message no longer overflows the text-box and block other content.

17.19   H1 Declaration reaches 'Clearance Provided' with missing mandatory data elements

Ref: PSD-8952	
Description	When submitting a H1 Declaration, it is possible to send through the declaration and receive the status of 'Clearance Provided (Goods Released)' even when missing mandatory data elements stated by the EUCDM.
Fix	The underlying issue was fixed.
Impact	Now when sending in the declaration with missing mandatory data elements, the declaration is correctly rejected.

17.20   Tariff Additional Code and the National Code should be optional for 4C

Ref: PSD-8960	
Description	When submitting a 4c form, the tariff additional code and national code should both be optional. However, if they are omitted it results in an error stating that they are required
Fix	The underlying issue was fixed.
Impact	Both the tariff additional code and national code can be omitted without causing an error

17.21   Preference code is deleted when H3 is presented in TP UI

Ref: PSD-8954	
Description	When a H3 pre-lodged declaration was submitted with the element preference code, and it has its goods presented via the Trader Portal UI the preference code is deleted.
Fix	The underlying issue was fixed.
Impact	Preference is declared with value 100

17.22   No CWMTAX sent when sending a H1 pre-lodged

Ref: PSD-8876	
Description	When submitting a H1 pre-lodged, no CWMTAX notification is sent to the trader for first round of customs calculations.
Fix	The underlying issue was fixed.
Impact	A CWMTAX message is sent and received by the trader.

17.23   Invalidation request for a G4 Pre-lodged is not granted automatically

Ref: FT-33804	
Description	According to the solution, if an invalidation request concerns a pre-lodged declaration, the invalidation request is automatically granted and the status of the declaration should be set to cancelled, however in this case a work task is created instead.
Fix	The underlying issue was fixed.
Impact	Now when the invalidation request is sent for a pre-lodged declaration, it is automatically granted and the status is set to cancelled.

17.24   I1 rejected without any reason or error code

Ref: PSD-8803	
Description	When an I1 declaration was rejected no message communicating the reason for the rejection was sent to the sender.
Fix	The underlying issue was fixed.
Impact	A rejection reason is communicated when a submitted declaration gets rejected.

17.25   Addition AK system is unable to handle countries with more than 1 zone

Ref: FT-32525	
Description	When using AK (Transport costs, loading and handling charges and insurance costs up to the place of introduction in the European Union) there is not more than 1 zone.
Fix	The underlying issue was fixed.
Impact	Countries (such as Canada) would have more than one zone.

17.26   Addition AK calculations are not correct

Ref: PSD-8009	

Description	When using AK in D.E. 14 04 with a mode of transport as '4 (Air Transport), the value is calculated by the value in 14 04 multiplied by 50% added to the value in 14 08 which is incorrect.
Fix	The underlying issue was fixed.
Impact	The values in D.E. 14 04 (1000) and D.E. 14 08 (1000) are added together (2000).

18 Release 6.1.5-RC11

Environment	Release date
PROD	N/A
TFE02	16-12-2024

18.1 Uploading Bill of Discharge to DMS Online makes the page go blank

Ref: PSD-8951	
Description	When uploading a Bill of Discharge (BoD) to an H1 declaration in DMS Online, the page became blank.
Fix	The underlying issue was fixed.
Impact	Submitting a BoD does not make the page go blank.

18.2 DMS Online functions disabled upon submitting invalid Invalidation

Ref: PSD-7852	
Description	When sending an invalid Invalidation request a CWMREJ message appeared. Closing this message caused the page to get stuck and not be able to be moved due to a missing scrollbar.
Fix	The underlying issue was fixed.
Impact	The message can be closed, and the scrollbar appears correctly on the page.

18.3 Lack of notifications upon timer expiration

Ref: PSD- 8924	
Description	When a user submits a G4G3 and lets the timer expire, no work task for ad-hoc discharge was created and no notification of this was sent to the user.
Fix	The underlying issue was fixed
Impact	The work task is now successfully created, and the relevant parties will receive the relevant notifications.

18.4 Translation error of time from English to Danish in Bill of Discharge

Ref: FT-33925	

Description	In **A163** (8f) there was a translation error from English to Danish, where "months" was incorrectly translated to "days".
Fix	Fixed the underlying issue
Impact	"Months" has been changed to "days" in the Danish translation of the A163.

18.5 The user is able to discharge from unclaimed consignment

Ref: PSD-8890	
Description	The user was able to discharge from a G4G3 in status Unclaimed, which should not be possible.
Fix	Fixed the underlying issue
Impact	The discharge is rejected when attempting to discharge a G4G3 in status Unclaimed.

18.6 Amendment automatically accepted for G4 after goods have been presented

Ref: FT-33882	
Description	When submitting an amendment for G4 after a G3 has been presented, Goods Released was automatically accepted.
Fix	The underlying issue has been fixed
Impact	An amendment submitted to a G4 after a G3 has been presented is successfully submitted, and a Manual Handling Task is Created

18.7 Lock symbol not behaving as expected

Ref: PSD-8878, PSD-8809	
Description	The lock symbol displayed on declarations in DMS Online was only displayed in a locked state when there were open work tasks or when the declaration was rejected/invalidated.

Fix	The underlying issue has been fixed.
Impact	The lock symbol is shown in the locked state when control of the declaration is in progress.

18.8 H6 - D.E. 14 10 000 000 CustomsValuation erroneously set to mandatory in the XSD, contradicting EUCDM

Ref: FT-33869	
Description	According to the H6 XSD, CustomsValuation is a required element, but according to EUCDM it is not.
Fix	CustomsValuation has been removed from H6 XSD.
Impact	Valuation method is not present in the H6 XSD.

18.9 DKW1209/BR_VALI_10085_37 showing null value and empty

Ref: FT-33864	
Description	The BR_VALI_10085_37 Error message was empty. DMS Online did not display any information about the error.
Fix	The underlying issue has been resolved.
Impact	The validation results should now be visible for this error message.

18.10 I2 standard not visible in TP-UI even though it is visible in CWM-UI

Ref: PSD-8849	
Description	I2 standard declarations were not visible in the Trader Portal UI (TP-UI) drop-down menu, but were visible in the Customs Web UI (CWM-UI).
Fix	The underlying issue has been fixed.
Impact	TP-UI and CWM-UI both display I2 standard declarations in the drop-down menu.

18.11   Pre-lodged declarations did not change type in TP-UI even after goods had been presented. (All import declarations)

Ref: PSD-8844	
Description	When sending an I2 goods presentation to any pre-lodged import declaration, to change it to a standard declaration, the declaration type field on the UI did not update from IM/D (CO/D for H5) to IM/A (CO/A for H5).
Fix	The underlying issue has been fixed.
Impact	The UI now updates the declaration type field to display that the declaration has become a standard declaration.

18.12   User could occasionally not delete Goods Items via the UI

Ref: PSD-8843	
Description	While editing goods items via the UI, multiple goods items with the same number can be created. This resulted in the user not being able to delete any goods items after this.
Fix	The underlying issue has been fixed.
Impact	All goods items can now be deleted, and goods items added via the UI obtain the correct sequence number.

18.13   Exporting a PDF in TP-UI is not possible

Ref: PSD-9057	
Description	When exporting a PDF for a Clearance Provided (goods released) declaration in TP UI an error message saying something went wrong appears. This has also been observed when sending a H1 and H4
Fix	The underlying issue has been resolved
Impact	The PDF will now open

18.14 Opening rejected declaration in TP-UI gives blank page

Ref: FT-34023	
Description	When a H2 declaration is submitted via TP-UI, the declaration is rejected, but when opening the rejection from search results a blank white page is shown.
Fix	The underlying issue has been resolved
Impact	The declaration overview page is reached.

18.15 Error DK1098 triggering unproperly

Ref: FT-33830	
Description	H3 should be rejected with a DK1098 error when its previous procedure is 71 and Warehouse is empty which it currently does not.
Fix	The underlying issue has been resolved
Impact	A H3 declaration with an empty warehouse is rejected and validation error DK1098 is thrown.

18.16 Fields resetting when adding/editing (VII/8 Duty) Types in RRA Creation

Ref: PSD-8789	
Description	When adding to (VII/8) duty types, fields in the RRA additional message are reset.
Fix	The underlying issue has been resolved.
Impact	The value is added and everything else stays as it is.

18.17 H4 with 8a authorization rejected

Ref: PSD-8806	
Description	Submitting a H4 declaration declaring an 8a authorization in D.E. 12 12 000 000, the declaration is rejected for violating BR10143_003: Authorization with type C601 does not contain authorizationElement: 4/18a in AuthorizationDetailList. Looking up the data element in EUCDM, it looks to be referring to a data element which codes for the requirement to submit a bill of discharge.
Fix	The underlying issue has been resolved.

| Impact | H4 declarations with 8a authorization can now be submitted. |

18.18   The field Measurement unit in TP-UI displays currencies instead of types of measurement

Ref: PSD-8793	
Description	When editing a declaration through TP-UI the field Measurement unit (03 040 005) under group 14, (03) calculation of tax display types of currencies instead of types of measurements.
Fix	The underlying issue has been resolved.
Impact	The user can now edit the measure unit field via the UI.

18.19   Missing Translation of 8F – D.E. 4/9

Ref: FT-33757	
Description	There is a lacking translation of the data element 4/9 in 8F application. The English version reads "Place(s) of processing or use" and is translated to "Sted hvor forarbejdningen foregår" in Danish. Hence the Danish translation lacks the wording "or use" is missing, which is confusing if the application is for H3 temporary admission. "Place(s)" is also translated as "sted" which is misleadning since multiple places can be provided.
Fix	Updated the translation to "Sted(er) hvor forarbejdningen foregår eller varen anvendes"
Impact	"Sted hvor forarbejdningen foregår" is changed to "Sted(er) hvor forarbejdningen foregår eller varen anvendes"

18.20   Pre-lodged H2 is registered with a rejection error message

Ref: FT-33751	
Description	Submitting the attached H2 pre-lodged results in status "registered". When checking the Message to trader CWMRCV a rejection reason is listed, that should result in a rejection. It seems the error message is actually just a warning for the declaration being selected for manual acceptance, but in that case the message should be adjusted to reflect a nonblocking-warning.
Fix	Change rejecting error code to warning When a declaration does not have a guarantee, it used to give the error code CWM11050 but is now DKW10053.

Impact	The error code mentioned has been renamed to DKW10053.

18.21   When sending an H1 with an end-use Authorization it is rejected

Ref: FT-33707	
Description	When sending an H1 with an end-use (8c) authorization N990 the declaration is rejected for not containing an element relating to 8f.
Fix	The underlying issue has been solved.
Impact	Users can now send H1 end-use declarations.

18.22   H7 getting stuck due to backend issues

Ref: FT-33683	
Description	When submitting an H7 declaration with certain procedure combination, a backend issue results in the declaration getting stuck.
Fix	The underlying issue has been resolved.
Impact	The declaration proceeds through Tariff and other validations without getting stuck.

18.23   Unable to submit Quota order number for an additional message (COR/SUP) as a Trader Portal-user

Ref: PSD-8615	
Description	If the quota order number (99 01) has leading zeros, the number is automatically simplified resulting in the value being invalid.
Fix	Allow quota text field to have leading zeros
Impact	Users can now enter quota order numbers with a proper format

18.24   Some G4G3 declarations are getting stuck after Risk

Ref: PSD-8690	
Description	Some G4G3 declarations are getting stuck after Risk assessment.
Fix	The underlying issue has been fixed.

Impact	The user can now send a G4G3.

18.25   All Goods Items on H2 declaration are deleted when the first Goods Item is deleted.

Ref: PSD-8815	
Description	If a pre-lodged H2 declaration is sent which contains 3 Good Items, and the first Goods Item is deleted, it will give an error, and the goods item is not deleted.
Fix	The underlying issue is resolved.
Impact	The first Goods Item is deleted and Goods Item 2 and 3 are left untouched.

18.26   Declarations disappear when a first time user submits to Trader Portal

Ref: PSD-8551	
Description	When a user accesses Trader Portal for the first time, the user would not be able to create a new declaration right away.
Fix	The underlying issue is resolved
Impact	The declaration is visible and can be submitted the first time the user uploads a file

18.27   Timer doesn't change according to first submitted G4G3 when submitting a second G4G3

Ref: PSD-8776	
Description	When a G4G3 is created that refers to an already submitted, older G4G3, the new G4G3's timer is not set based on the older G4G3's timer. Instead, the new G4G3's timer is created as its own new timer.
Fix	The underlying issue has been resolved.

Impact	The new G4G3's timer is now set based on the referred G4G3's timer.

18.28 A H6 declaration with a supporting document on goods items level gets rejected.

Ref: FT-33094	
Description	If a H6 has a correct supporting document Y929 or C644 on goods item level instead of shipment level the declaration gets rejected for not including either document Y292 or C644.
Fix	The underlying issue has been fixed.
Impact	Users are able to send an H6 with its supporting document on goods item level.

18.29 When trying to add an Additional reference to a declaration some document types are missing.

Ref: FT-32852	
Description	When trying to add an Additional reference to a declaration the document types Y792, Y160, Y930, Y904, Y797, Y798, Y799 and Y163 and others are missing.
Fix	The underlying issue has been fixed.
Impact	It is now possible to add the missing type codes for an additional reference.

18.30 Information of attached documents not shown after declaration is accepted

Ref: FT-32472	
Description	When attaching documents to declaration in TP-UI the information was not displayed.
Fix	The underlying issue was fixed.

Impact	It is now possible to see the information on attached documents in TP-UI.
